prologue

Guillermo Reglero
Director of the IMDEA Food Institute

report 2016
Ten years have passed since the launch of the IMDEA Food project, enough for us to confirm that the hypothesis upon which its research lines were based was solid: nutrition can be an effective tool in the prevention and treatment of chronic disease, and can maintain and improve people’s quality of life.

When our project started, the human genome had only recently been sequenced, but the extraordinary advances it would allow lay in clear view. And indeed, expectations have been met and even surpassed. Today, progress continues to be made in the life sciences, and the discoveries being made could, in a few years, lead to paradigm shifts in the treatment of cancer, aging and cardiometabolic disease. These are goals towards which food and nutrition science is making an exceptional contribution: different nutrients and food products have been shown to play vital roles in the body’s molecular mechanisms.

Knowledge of these processes, and the possibility of controlling them via what we eat, has opened up the field of personalised nutrition. This seeks to invest dietary strategies aimed at improving health with the greatest effectiveness. This, however, can only be achieved when the genetic profile of individual persons, and the context in which they live (together dictating their physiological status), are taken into account. With this knowledge, precision, individualised nutritional interventions can be prescribed, a concept that in the coming years will form part of our everyday lives.

In 2016, IMDEA Food took a major step forward in its organisational structure, creating 5 programmes in the area of Precision Nutrition, 4 dealing with chronic disease - cancer, aging, obesity, cardiometabolic disease - and the fifth with the design and validation of products. During the year, staff numbers increased by 24%, and the Institute now has 45 researchers and 7 people of management and administration. This report describes the work performed during 2016, guided by the Institute’s consolidating axes: Science, Business, and Society.

The Institute’s researchers published 82 articles in 2016, 72% of these covered by the Q1 del Science Citation Index (the most important international citation index), achieving an average impact factor of 5.74. The publications produced by the Institute since its inauguration have now been cited by other researchers over 5,000 times.

Our work with businesses has been very fruitful. The personalised nutrition project, arising from the CDTI’s CIEN calls for projects, has returned very satisfactory results of clear industrial importance. In the 2016 calls, 2 more CIEN projects were approved in which IMDEA Food is a participating member; both focus on nutrition and precision medicine. In addition, a patent was registered describing a novelty in the formulation of food products for the improvement of health. This has attracted the interest of several firms, and its industrial use is expected by 2017. The Institute has also been involved in setting up a spin-off business for translating to society the benefits of its scientific findings, and has made a contribution to the economy of the Madrid region.
As well as transferring research findings to businesses, the Institute undertakes translatable research that provides hospitals with nutritional strategies for the treatment of chronic diseases. In close collaboration with the La Paz and Infanta Sofía hospitals, precision nutritional therapies are designed for use in patients with cancer, and a clinical trial is now underway in patients with colon cancer.

The Institute’s work focusing on Society includes research into rare diseases, such as multiple chemical sensitivity syndrome. A trial has also begun among schoolchildren in the Madrid region, run with the help of the Consejería de Educación, Juventud y Deporte, investigating educational strategies to combat genetic susceptibility to obesity. Finally, 42 bachelors and masters degree students from different universities undertook project work at the Institute during 2016, and 11 postgraduate students are currently performing doctoral work.

The Institute has enjoyed funding for R&D projects from the main national and EU financing programs. Currently, 12 projects receive public funding, 10 are privately funded, and funds from different sources have been awarded for contracting researchers and technicians. In 2016, self-financing was up from 19 to 28%, and a ‘Nominative Subsidy’ was awarded by the Madrid Regional Government on the basis of the results obtained. The latter is the major funding source for the Institute.

Given the high rate of morbidity associated with chronic diseases - the onset and progress of which may be nutrition-associated - and faced with a food industry in Spain that shows little innovation despite facing strong international competition, Spanish society needs food R&D results.

The overall aim of IMDEA Food is to undertake high level research in the area of Precision Nutrition. Its founding mandate is to translate health and nutrition research into benefits for the economy of the Madrid Region and wider Spain, and into the wellbeing of the country’s inhabitants. It aims to undertake world class research into food, nutrition and health, and to identify nutritional strategies of economic and social value.

The Institute’s activities are orientated towards studying the molecular mechanisms of the human body, the physiological effects of chronic disease, and how these are related to the nutrients we consume. Nutritional strategies need to be designed and validated with Precision Nutrition in mind, and must therefore focus on individuals and their particular characteristics, i.e., their genetic profile and particular physiological status.

**Strategic axes**

IMDEA Food organises its activities around three strategic axes:

**Axis 1. Science:** Advancing scientific knowledge in the area of food and health, with a special focus on the prevention of chronic diseases.

**Axis 2. Business:** Contributing towards the economic development and competitiveness of the food industry via the design and validation of nutritional strategies and food products of proven effectiveness in the prevention and treatment of chronic diseases.

**Axis 3. Society:** Contributing towards the reduction of healthcare costs and improving the wellbeing of the population through the study of the relationship between diet and health, the execution of communication programmes, and via the dissemination of nutrition advice.

**R&D Programmes**

IMDEA Food has 5 R&D programmes:

**Precision Nutrition and Obesity**

The aim of this program is to gain knowledge about how different dietary patterns and specific nutrients modulate the cardiovascular disease risk and related pathologies with emphasis on obesity using two complementary approaches: epidemiological and molecular.
Precision Nutrition and Cancer

Precision Nutrition and Cancer Program addresses different areas of knowledge including the precise (molecular) mechanism of action of bioactive compounds present in foods, the genetic profile and its impact in the personal susceptibility to develop cancer and respond to specific treatments, as well as the development of specific strategies for current personal physiological conditions.

Precision Nutrition and Cardiometabolic Health

This PRECISION Program (Personalized Related Energomics and Cardiometabolomics: interactions Involving Inheritance Obesity and Nutrition) is focused on understanding genetic and epigenetic outcomes involved in obesity and cardiometabolic adverse traits and on implementing newer metabolic biomarkers to design Precision Nutrition guidelines.

Precision Nutrition and Aging

The recently created Precision Nutrition and Aging Program at IMDEA Food is focused on the molecular and physiological effects that nutrition exerts on the process of aging. Covering a wide range of biological topics, from the discovery and development of new bioactive products active against aging-related pathologies, to the dissection of different molecular pathways involved in degenerative pathologies, or the study of nutritional interventions with anti-aging properties.

Food Products for Precision Nutrition

The aim of this programme is to validate new food products and nutritional strategies based on discoveries made in the Institute’s other programmes. The goal is to bring to society the benefits of research into Precision Nutrition by translating to industry the advances made.

Platforms

IMDEA Food has 3 ‘strategic platforms’ that provide scientific services both internally and to other groups and businesses (national and international), thus contributing to the transfer of scientific and technological knowledge.

Platform for Clinical Trials in Nutrition and Health. GENYAL

This focuses on human nutrigenetic studies. It has its own ethics committee, plus it own nutrition, clinical trials, biostatistics, bioinformatics, genomics and training groups, potentiating its ability to provide scientific services in the area of food and nutrition.

Interactive Centre for Nutrigenomics. CIN

“Nutrition, food and health: from the laboratory to society”. This is a multi-topic exhibition with a single aim: to provide visitors with research-derived tools for maintaining a healthy lifestyle through responsible nutrition. Information is made available via the use of video, tactile, structural, mechanical, hands-on and scenographic exhibits.
Cooperative Activity Laboratory for R+D+I. LACID

This provides a collaboration framework for applied research, the development of technology, and innovation, in the field of nutrition, food and health. IMDEA Food and other participating bodies share financial commitments, human resources, spaces and infrastructure in the development of R+D+I projects.

Ethical responsibility

IMDEA Food is conscious of its duty to society regarding the oversight of the research it conducts and its ethical component. The Institute guarantees its respect for the principles adhered to, and bioethical responsibilities recognised by, the scientific community, as outlined in its founding statutes.
research, programs, groups and platforms

2.1 Research Program.
Precision Nutrition and Obesity [14]
- Nutritional Genomics and Epigenomics Group
- Neuroendocrinology of Metabolism Group
- Cardiovascular and Nutritional Epidemiology Group

2.2 Research Program.
Precision Nutrition and Cancer [20]
- Molecular Oncology Group
- Clinical Oncology Group
- Molecular Immunonutrition Group

2.3 Research Program.
Precision Nutrition and Cardiometabolic Health [31]
- Cardiometabolic Nutrition Group
- Bioactive Ingredients Food Group
- Epigenetics of Lipid Metabolism Group

2.4 Research Program.
Precision Nutrition and Aging [39]
- Metabolic Syndrome Group
- Nutritional Interventions Group

2.5 Research Program.
Food Products for Precision Nutrition [44]

2.6 Research Platform.
Platform for Clinical Trials in Nutrition and Health. GENYAL [47]

2.7 Research Platform.
Nutrigenomics Interactive Center. CIN [56]

2.8 Research Platform.
Cooperative R + D + I Laboratory. LACID [59]
In 2016 a new organizational research structure based on thematic programs has been established, whose specific objectives are addressed by specialized research Groups and 3 scientific Platforms:

- **Research Program. Precision Nutrition and Obesity**
  - Nutritional Genomics and Epigenomics Group
  - Neuroendocrinology of Metabolism Group
  - Cardiovascular and Nutritional Epidemiology Group

- **Research Program. Precision Nutrition and Cancer**
  - Molecular Oncology Group
  - Clinical Oncology Group
  - Molecular Immunonutrition Group

- **Research Program. Precision Nutrition and Cardiometabolic Health**
  - Cardiometabolic Nutrition Group
  - Bioactive Ingredients Food Group
  - Epigenetics of Lipid Metabolism Group

- **Research Program. Precision Nutrition and Aging**
  - Metabolic Syndrome Group
  - Nutritional Interventions Group

- **Research Program. Food Products for Precision Nutrition**

- **Research Platform. Platform for Clinical Trials in Nutrition and Health. GENYAL**

- **Research Platform. Nutrigenomics Interactive Center. CIN**

- **Research Platform. Cooperative R + D + I Laboratory. LACID**

### PROGRAMS, GROUPS AND R+D+I PLATFORMS IN HEALTH AND FOOD

**R+D+I Platforms**
- GENYAL
- CIN
- LACID

**Research Programs and Groups**

**PROGRAMS**
- **Precision Nutrition and OBESITY**
  - Prof. José María Ordovás
- **Precision Nutrition and CANCER**
  - Dr. Ana Ramírez de Molina
- **Precision Nutrition and CARDIOMETABOLIC HEALTH**
  - Prof. Alfredo Martínez
- **Precision Nutrition and AGING**
  - Dr. Manuel Serrano
- **FOOD PRODUCTS for Precision Nutrition**
  - Prof. Guillermo Reglero

- **Nutritional Genomics and Epigenomics**

- **Molecular Oncology**
  - Dr. Ana Ramírez de Molina
- **Cardiometabolic Nutrition**
  - Prof. Alfredo Martínez
- **Metabolic Syndrome**
  - Dr. Pablo Fernández

- **Neuroendocrinology of Metabolism**
  - Prof. Dr. Jesús Argente
- **Clinical Oncology**
  - Dr. Enrique Casado and Dr. Jaime Feliú
- **Bioactive Ingredients Food**
  - Prof. Francesco Visioli
- **Nutritional Interventions**
  - Dr. Rafael de Cabo

- **Cardiovascular and Nutritional Epidemiology**
  - Prof. Fernando Rodríguez
- **Molecular Immunonutrition**
  - Dr. Moisés Laparra
- **Epigenetics of Lipid Metabolism**
  - Dr. Alberto Dávalos
2.1 Research Program. Precision Nutrition and Obesity

**Director:** Prof. José María Ordovás Muñoz

Objectives: Diet and exercise play an important role in the development and treatment of obesity and its comorbidities; however, it is well known that there is a dramatic inter-individual variability in the response to any therapeutic diet or physical regime aimed to prevent obesity and/or return to a healthy body weight. In order to understand an individual's susceptibility to becoming obese and their responsiveness to weight loss interventions we need to generate new knowledge at the molecular level using the tools provided by genetics and epigenetics as well as other omics, such as metabolomics. Most important in the current obesity epidemics is the fact that obesity begins early in life; therefore is of paramount importance that we understand the neurobiological factors that drive childhood obesity in order to decrease the current rates both at early ages as in the aging population. It is precisely the later group that is being most seriously affected by the comorbidities of obesity (i.e., diabetes, cardiovascular diseases and cancer); therefore, until such time that the developments of Precision Nutrition, in particular, and precision medicine in general, provide the means to prevent those diseases we need to develop better measures to improve the quality of life of those already in the elderly category and this can be done with the information provided by longitudinal cohorts designed to provide solid information about the current risk factors and facilitate the pathway to a healthy aging.
Nutritional Genomics and Epigenomics Group

Group leader: Prof. José María Ordovás Muñoz

Objectives: our group aims to provide genomic tools and knowledge to manage obesity and related comorbidities at the individual level through:

1. The identification of genetic variants predisposing to obesity.

2. The definition of how these variants interact with the diet to modulate such predisposition.

3. The understanding of the dietary modulation of the how diet is able to modulate the obesogenic epigenome.

Members:

Dr. Lidia A. Daimiel Ruiz  
Postdoctoral researcher

Silvia Berciano Benítez  
Predoctoral researcher

Víctor Micó Moreno  
Predoctoral researcher

Laura Berninches Pintado

José Antonio Celada Guerrero
Prof. José María Ordovás Muñoz  
Director of the Precision Nutrition and Obesity Program and Group leader of the Nutritional Genomics and Epigenomics Group

José M. Ordovás, PhD, is Professor of Nutrition and Genetics and a Senior Scientist at the USDA-HNRCA at Tufts in Boston, and Director of the Nutrition and Genomics Laboratory. Dr. Ordovás graduated from the University of Zaragoza and did postdoctoral work at the MIT, Harvard and Tufts. He has published over 700 scientific articles in peer review journals (h-index 92) and written numerous reviews and books. In this regard, he is considered one of the most distinguished world experts in gene-diet interactions related to cardiovascular traits. Throughout his career, Dr. Ordovás has received multiple honors for his scientific achievements. He has been awarded an honorary degree in Medicine from the University of Córdoba in Spain and he is Member of the Royal Academies of Sciences, Medicine, Nutrition and Pharmacy.

Dr. Lidia A. Daimiel Ruiz  
Postdoctoral researcher

Dr. Lidia Daimiel Ruiz graduated in Biology at Universidad Autónoma de Madrid where she carried out postgraduate studies about the genetic and epigenetic alterations associated with colorectal cancer onset and progression, under the supervision of Prof. Juan José González Aguilella and Prof. Mª Antonia Fernández. The studies conducive to her PhD were developed at Hospital Ramón y Cajal and were focused in the study of cholesterol-mediated gene regulation, under the supervision of Dr. Javier Martínez-Botas. She joined IMDEA Food in 2011 to carry out her postdoctoral research under the supervision of Prof. Jose Mª Ordovás. Her research at IMDEA Food focuses on the dietary modulation of the epigenetic mechanisms associated with cardiovascular disease. Along her career, she has published her results in international peer-review journals of the first quartile and high impact. Additionally, she carries out teaching activities as Associate Professor at Universidad San Pablo CEU. In the last years, Dr. Lidia Daimiel has joined to the prestigious consortium PREDI-MED-PLUS as Principal Investigator at IMDEA Food, is supervising PhD Thesis and has performed a postdoctoral stay as Visiting Professor of the Vascular Biology and Therapeutics program at Yale University.

Silvia Berciano Benítez  
Predoctoral researcher

Silvia Berciano Benítez obtained her first class BSc (Hons) Molecular Biology and Genetics degree from the University of Westminster (2013) and a Master’s degree in Agricultural Chemistry and Novel Foods from the Universidad Autónoma de Madrid (2014). During the final years of her undergraduate education, Silvia investigated the relationship between BMI and Differentially Methylated Regions (DMRs) within the HTR2C gene promoter, gaining a keen understanding of how epigenetic mechanisms can potentially modulate mood, behavior and health. Silvia also undertook volunteering laboratory roles during the summer months, designing novel genetic constructs to target Cancer Stem Cells. In November 2013, Silvia joined Prof. Ordovás’ group at IMDEA Food as a predoctoral researcher, where she is currently investigating genetic and epigenetic mechanisms associated with executive functions affecting dietary habits, with emphasis on inhibitory control.
Víctor Micó Moreno
Predoctoral researcher

Víctor Micó Moreno studied at Complutense University of Madrid where he completed his degree in Human Nutrition and Dietetics (2010). Later, at Balearic Islands University, he completed the Nutrigenomics and Personalized Nutrition Master (2011) where he presented his final project: “Maternal caloric restriction during lactation can affect muscle metabolism in the offspring depending on gender and diet”. Finally, at Autónoma University of Madrid, he completed his degree in Food Science and Technology (2013).

In 2014, Víctor was awarded the XIV Manuel de Oya scholarship for the project: “Influence of beer consumption on circulating microRNAs related to cardiovascular health. Exogenous beer microRNAs as health-promoting agents”. In April 2014, Víctor joined IMDEA Food Institute’s in the Nutritional Genomics and Epigenomics Group as a predoctoral researcher where he currently studies the effect of Caloric restriction on epigenetic mechanism and their influence on cardiovascular health and healthy aging.

Laura Berninches Pintado
Technician

Bachelor’s Degree of Science in Physical Activity and Sports and bachelor’s degree in Human Nutrition and Dietetics granted in the Universidad Autónoma de Madrid. Expert in diagnosis, treatment and management of obesity by the UNECertified ISAK (International Society for the Advancement of Kinanthropometry).

Throughout his academic and professional career she has carried out various activities related to nutrition, physical activity, sport and health. She has collaborated with various public and private entities. As well she has participated as a member of the research team on the project “Evaluation of physical activity, fitness, anthropometry and body composition, and its relationship with diseases related to sedentary lifestyles” awarded by the Spanish institution Ministerio de Educación y Ciencia. She is the author with other professionals of the published guide economic and healthy food, the NGO. (Nutrición Sin Fronteras). In 2015 she joined IMDEA Food as a nutritionist in the Nutritional Genomics and Epigenomics Group. Her work focuses on the study PREDIMED-PLUS “Effect of study of life based on a traditional Mediterranean diet with energy restriction, physical activity and behavioral therapy for the prevention of cardiovascular disease”.

Javier Tapia Belloso
Technician

Diploma in Human Nutrition and Dietetics from the University of Zaragoza. Currently Graduated in Physiotherapy from the Universidad Europea de Madrid. Expert in Sports Nutrition and High Performance by the School of Sports Medicine of the Universidad Complutense de Madrid. Certified as Cineanthropometrist by ISAK (International Society for the Advancement of Kinanthropometry).

Director and Coordinator of Leisure Time Educational Activities and Expert in School Dining, has participated in the planning of menus and nutrition education programs aimed at children.

He has collaborated in A.D. Alcorcón SAD, coordinating the Nutrition Area of the base football. Likewise, he has worked as Dietician-Nutritionist in the private clinic.

In 2016 he joined IMDEA Food as a nutritionist in the Nutritional Genomics and Epigenomics Group. His work focuses on the study PREDIMED-PLUS “Effect of an intensive lifestyle intervention based on a traditional Mediterranean diet with energy restriction, physical activity and behavioral treatment on the prevention of cardiovascular disease.”
Neuroendocrinology of Metabolism Group

Group leader: Prof. Dr. Jesús Argente Oliver

Objectives: our strategic objectives are as follows:

1. To understand the causes of childhood obesities, including epigenetics, genetics, genomics and metabolomic influences.

2. To investigate the interaction between genetics and nutrition on metabolic and health outcomes.

3. To analyze comorbidities in children with severe early onset obesity.

4. We use animal models to try to understand the effects of early nutrition and hormonal changes on long-term metabolic health. At a cellular level, we are interested in how the brain, especially glial cells, respond to specific nutrients to affect metabolism and neuroinflammation.

Prof. Dr. Jesús Argente Oliver
Professor and Director of the Department of Pediatrics at the Universidad Autónoma de Madrid. Director of the Department of Pediatrics, Chairman of the Department of Pediatric Endocrinology and Director of the Laboratory of Research, Niño Jesús University Hospital
Associate researcher, IMDEA Food
Group leader of the Neuroendocrinology of Metabolism Group

He is Full Professor and Director of the Department of Pediatrics at the Universidad Autónoma de Madrid, Director of the Department of Pediatrics and Chairman of the Department of Pediatric Endocrinology and Director of the Laboratory of Research at the Niño Jesús University Hospital in Madrid, Spain and is IP in the CIBER of Obesity and Nutrition, being the leader of the childhood obesity program.

He obtained his medical degree at the University of Zaragoza and completed his pediatric residency at the Hospital Ramón y Cajal in Madrid and has worked at the Hospital Saint Vincent de Paul in Paris, France, the University of Virginia in Charlottesville, VA, USA and at the University of Washington in Seattle, WA, USA. His main research interests include childhood obesity, pathophysiology of human growth, puberty, eating disorders and diabetes.

He has published more than 300 original articles and has lectured in more than 30 countries. He is past president of the European Society for Pediatric Endocrinology (ESPE) and past president of the Spanish Society for Pediatric Endocrinology (SEEP). He has obtained multiple national and international awards for his research.
Cardiovascular and Nutritional Epidemiology Group

Group leader: Prof. Fernando Rodríguez Artalejo

Objectives: Our strategic objective is to produce relevant information to support clinical and population-based policies aimed at controlling cardiovascular diseases and their functional adverse outcomes. Specifically, we work on the following research areas:

1. Nutritional and omic determinants of frailty and functional status in the older adult.
2. Diet and physical activity as determinants of obesity and cardiovascular risk in the elderly.

The results of our studies have been incorporated into the National Strategy for Ischemic Heart Disease Control, the National Strategy for Obesity Prevention and Control, and the National Strategy on Disease Prevention and Health Promotion, elaborated by the Ministry of Health of Spain. Our group aims to provide genomic tools and knowledge to manage obesity and related co-morbidities at the individual level through:

1. The identification of genetic variants predisposing to obesity.
2. The definition of how these variants interact with the diet to modulate such predisposition.
3. The understanding of the dietary modulation of the how diet is able to modulate the obesogenic epigenome.

Prof. Fernando Rodríguez Artalejo
Professor of Preventive Medicine and Public Health, Medical School of the Universidad Autónoma de Madrid
Associate researcher, IMDEA Food
Group leader of the Cardiovascular and Nutritional Epidemiology Group

Fernando Rodríguez Artalejo, MD, PhD, is Professor of Preventive Medicine and Public Health at the Medical School of the Universidad Autónoma de Madrid. Dr. Rodríguez Artalejo graduated from the Universidad Autónoma de Madrid and received postgraduate training in the La Paz University Hospital, the Institute of Health Carlos III and the Spanish Ministry of Health in Madrid, as well as in the London School of Hygiene and Tropical Medicine and the Johns Hopkins Bloomberg of Public Health in Baltimore. He has published over 400 scientific articles in peer-reviewed journals (h-index 51) and contributed to many policy documents on health planning and evaluation and on prevention and control of obesity and cardiovascular disease. He has received the Carles Martí Henneberg award to a scientific career on Nutrition Research, the Cirió Rozman award of the Spanish Society of Internal Medicine, the Silver Medal of the National Plan on Drug Addiction, and the Encomienda de la Orden Civil de Sanidad. Dr. Rodríguez Artalejo has been a member of the Scientific Committee of the Spanish Agency of Foods Safety and Nutrition, and currently serves in the European Advisory Committee of Health Research of the World Health Organization and in the Expert Panel of the European Joint Action on Prevention of Frailty (ADVANTAGE).
2.2 Research Program. Precision Nutrition and Cancer

**Director:** Dr. Ana Ramírez de Molina

**Objectives:** According to the most recent data published by leading authorities, a high percentage of cancer cases may be preventable. Diet and lifestyle are key factors in cancer prevention, but also exert essential function as coadjuvants for cancer patients during and after therapy. Metabolic reprogramming is a hallmark of cancer in which nutritional strategies might play a key role. Thus, it is necessary to develop personalized treatments based in molecular and metabolic alterations, combining complementary precision medicine and nutrition. We understand Precision Nutrition for cancer as highly efficiency products and strategies personalized for specific physiological conditions and population groups. This new way of understand Nutritional Sciences addresses different areas of knowledge including the precise (molecular) mechanism of action of bioactive compounds present in foods, the genetic profile and its impact in the personal susceptibility to develop cancer and respond to specific treatments, as well as the development of specific strategies for current personal physiological conditions.
Molecular Oncology Group
Group leader: Dr. Ana Ramírez de Molina

Objectives: the group is currently focused on three research topics:

1. Lipid metabolism disorders in cancer: identification of new biomarkers and therapeutic targets in diet-related tumors.

In this subject, the work of our group mainly focuses on the analysis of lipid metabolism alterations in cancer. Most specifically, we aim at studying the special energetic and structural requirements of tumor cells as well as identifying novel biomarkers of progression and response to therapy, which may represent new therapeutic targets.

To this end, in close collaboration with the divisions of Medical Oncology from several hospitals, we analyze clinical samples from cancer patients using state-of-the-art genomic approaches. Gene expression analysis, identification of gene variants and epigenetic regulation by microRNAs of lipid metabolism pathways are then used to study their association with the clinical outcome of the disease. Furthermore, we perform functional studies both using conventional and three-dimensional cell culture such as organoids, and animal models to investigate the role of identified genes and microRNAs. We are especially interested in identifying metabolic profiles associated to the disease progression and analyzing their role from in-vitro cell systems to cancer patients. These analyses are mainly focused on the identification of metabolic pathways and distinctive oncometabolites that may constitute novel markers and targets for the development of future cancer therapies, as well as the genetic basis of the relationship between obesity, associated metabolic disorders and cancer.

We evaluate the activity and molecular mechanism of action of bioactive compounds that may have a therapeutic use in cancer, either alone or in combination with existing chemotherapy. The aim is to establish the scientific basis for the development of nutritional supplements that may exert a beneficial effect on the disease.

In close collaboration with the Bioactive Food Ingredients Group from the Research Institute of Food Science (CIAL, CSIC-UAM), we design and characterize different formulations of bioactive compounds. We combine genomics and functional studies in cell lines and intestinal organoids to determine the effect and target populations for personalized therapeutic use of these formulations. These products are further evaluated in animal models and finally, in clinical trials in healthy volunteers or cancer patients. Recently, we have evaluated the antitumor effect of a supercritical extract of rosemary approved as safe for human use by EFSA. Such extract inhibits proliferation, induces cell death, and potentiates the effect of chemotherapy, both in sensitive and resistant colon cancer cells. Its formulation for human consumption shows an immunomodulatory effect in healthy volunteers and it is currently being used in a phase-I clinical trial in cancer patients.

Dr. Ana Ramírez de Molina
Deputy Director, Director of the Precision Nutrition Program and Group leader of the Molecular Oncology Group

Dr. Ana Ramírez de Molina has developed her scientific career in the field of lipid metabolism, molecular oncology, nutrition and cancer. She has worked as an associated researcher in the Translational Oncology Unit CSIC-UAM-La Paz Hospital (Madrid), and has performed long postdoctoral stays at Cancer Research UK Centre for Therapeutics (London) and the Molecular Pathology Division of the Sloan Kettering Cancer Center (New York). She has published more than 60 scientific articles in her research field, is co-inventor of 6 patents in different phases of exploitation by a biotechnology company and has supervised 6 PhD Thesis. Several of her patents promoted the creation of a spin-off company from CSIC focused on the development of new tumour markers and therapies in Cancer in which she was former Director of Research, Development and Innovation for more than 3 years. She joined IMDEA Food Institute in 2010, where she leads the Programe of Precision Nutrition and Cancer. From 2011 she has been the Coordinator of Research, Development and Transfer, and in 2014 was promoted to Deputy Director of the Institute. In 2002 she was awarded with the prize Young Researchers MSD, in 2003 the extraordinary doctorate recognition as the best Thesis of her promotion in Molecular Biology, and in 2016 the 8th March distinction from the Community of Madrid as an outstanding woman in Science.

Dr. Teodoro Vargas Alonso
Postdoctoral researcher

He obtained his PhD in Biochemistry and Molecular Biology at Universidad Complutense de Madrid in 2010 and has joined to IMDEA Food in 2011 in the Molecular Oncology Group for the study of the effects of bioactive components of food on cancer prevention in the research project “Identification of bioactive compounds with anti-tumoral activity in human cancer”. Actually, he has working in the identification of genetic markers as predictive factors in the prognosis/diagnosis of patients with cancer and in the identification of bioactive compound with anti-tumoral activity for therapeutic use. In the last years he has published 18 articles in prestigous international journals of his research field, and is co-inventor of 1 patent focused on the development of a genetic signature that was able to predict risk of relapse in colon cancer patients.

Dr. Ruth Sánchez Martínez
Postdoctoral researcher

Dr. Ruth Sánchez Martínez, obtained her BSc at the Oviedo University (2001). Her PhD training (2002-2007) was focused on the molecular mechanisms of action of nuclear receptors of thyroid hormone, vitamin D and retinoids under the supervision of Prof. Ana Aranda at the IIB Madrid (CSIC). In 2008 she joined, as a postdoctoral fellow, Dr. Marcos Malumbres group at the CNIO to study the role of new proteins involved in mitotic exit regulation of importance in cancer therapy using genetically modified mice. She also studied microRNA regulation of several important cell cycle regulators. In the last years she has published several articles in prestigious international journals and she took part in both national and international research grants and consortiums. In 2012 she joined IMDEA to study new biomarkers and bioactive compounds in human cancer.

Dr. Marta Gómez de Cedrón Cardeñoso
Postdoctoral researcher

Dr. Marta Gómez de Cedrón, obtained her Bachelor’s degree in Biological Sciences (BSc) at the University of the Basque Country (UPV-EHU). Her PhD training was performed at the National Centre of Biotechnology (CNB-UAM-CSIC) under the supervision of Dr. Juan Antonio Garcia Alvarez “Enzymatic characterization of cylindrical inclusion protein (CI) of Plum Pox Virus”. In 2005 she moved as a postdoctoral researcher (Fullbright Grant) to the Institute for Biological Sciences (IBS-NRC) in Canada at Danica Stanimirovic’s lab. Her research aimed to elucidate the role of mutants of Grb7 mutants in the stimulation of angiogenesis in glioblastomas. In 2006 she joined Dr. Marcos Malumbres’ group at the Spanish National Cancer Research Centre (CNIO). During this period, she worked in mouse models for depletion (cKO) and overexpression (iKI) of microRNA-203 and its role in skin cancer and leukaemias. In 2013 she joined Ana Ramírez de Molina’s lab at IMDEA Food Institute (Molecular Oncology Group). Her interests are the study of (1) Cell Metabolism alterations (specifically lipid metabolism) in Chronic Diseases related to Nutrition, and (2) the characterization of the Biological Activities of Bioactive Compounds and Plant derived Extracts to be used as supplements in the prevention/treatment in human cancer.
Dr. Lara P. Fernández Álvarez
Postdoctoral researcher

Lara P. Fernández Álvarez, obtained her PhD in Biochemistry, Molecular Biology and Biomedicine from the Autonoma University of Madrid (UAM) and the Spanish National Cancer Research Centre (CNIO), Spain, in 2009. Her thesis focused on the characterization of genetic susceptibility to malignant melanoma. Since 2010, she has conducted postdoctoral research at the Molecular and Cell Biology of the Thyroid group in the Biomedical Research Institute (IIBm-CSIC-UAM), in Madrid. In December 2014 she joined IMDEA Molecular Oncology Group.

She has a solid professional experience in the biology of cancer, molecular endocrinology, transcription factors and thyroid signalling pathways, as well as human genetics, cancer susceptibility and oncogenes. Additionally, she has published several research articles in the field of thyroid, melanoma, and breast cancer.

Dr. Juan Moreno Rubio
Postdoctoral researcher

Currently Juan Moreno Rubio combines his work as a collaborator in the group of Molecular Oncology of IMDEA Food with the coordination of the Precision Oncology Laboratory (POL) of the Infanta Sofia University Hospital. Previously, he coordinated the Laboratory of Translational Oncology of La Paz Hospital (IdiPAZ, Group 32) and performed his doctoral thesis (Excellent Cum Laude) in the Osteoarticular Pathology Laboratory (IISFJD). As a result of this activity has participated in 26 publications in international scientific journals, has taken part in 11 research projects, 7 of these projects financed in competitive public calls. He has been involved in the invention of 2 patents, has directed 2 doctoral theses and he has given numerous communications to international conferences.

Dr. Cristina Aguirre Portolés
Postdoctoral researcher

Dr. Cristina Aguirre Portolés, BS in Biology at Autonoma University in Madrid, started her scientific career at the Spanish National Cancer Institute in 2006. Her studies were mainly focused in the role of the mitotic protein TPX2 both in mouse development and tumorigenesis in adults. Part of this research was performed at the Max Plank Institute of Molecular Cell Biology and Genetics under the supervision of Dr. Anthony Hyman.

After obtaining her PhD degree in Molecular Biology and Genetics she joined the European Molecular Biology Laboratory (EMBL) in 2012. She focused her work in the implication of chromosomal instability in the initiation, progression and regression of non-small-cell lung cancer (NSCLC). She joined IMDEA in 2014 as a postdoctoral researcher focusing her studies in the association between metabolic syndrome, obesity and cancer.
Jorge Martínez Romero
Predoctoral researcher

Jorge Martínez Romero is currently working on his Doctoral Thesis at the IMDEA Food Institute’s Molecular Oncology Group, after completing the Diploma in Human Nutrition, the Degree in Human Nutrition and Dietetics and a Masters in Agricultural Chemistry and Novel Foods from the Universidad Autónoma de Madrid (2014). He holds a Bachelor of Economics Science ICADE E-2 degree from Pontificia University of Comillas (1989), and has led several companies related to the manufacture and assembly of machinery for the food industry. He currently combines his work in the field of research with his business administration.

Silvia Cruz Gil
Predoctoral researcher

Silvia Cruz Gil obtained her Biochemistry Degree at Universidad Complutense de Madrid in 2013. During the last two years of her degree she collaborated with the Biochemistry II Department at Pharmacy School in Universidad Complutense de Madrid studying the molecular biology of hepatocellular carcinoma. Later, she continued her training by obtaining a Master in Molecular Biosciences at Universidad Autónoma de Madrid in 2014. Meanwhile, Silvia joined ALGENEX (Alternative Gene Expression S.L.) in association with I.N.I.A. (National Institute of Agricultural and Food Research and Technology) for an internship. During this period she worked in the development of vectored vaccines. In October 2014, she started studies conducive to her PhD Degree at IMDEA Food Institute in the Molecular Oncology Group. Her research primarily focuses on the role of the lipid metabolism in tumor progression. In April 2016 she obtained a Boehringer Ingelheim Travel Grant to perform a short research stage in the University Hospital Carl Gustav Carus (Dresden, Germany) to learn organoids technique under the supervision of Dr. Daniel Stange.
Clinical Oncology Group

Group leaders: Dr. Enrique Casado Sánz and Dr. Jaime Feliú Batle

Objectives: Cancer is a complex disease, whose characteristics, prognosis and response to different treatments depends on several factors, including the patient’s genome, environmental causes such as exposure to contaminants, and microenvironmental causes such as nutritional status or immunological condition of the patient; This complexity makes it imperative that cancer research must be done in a multidisciplinary way and with the joint efforts of many researchers.

Under the premise that diet and lifestyle are key factors in both cancer prevention and treatment, and in close collaboration with the other groups that are part of the Precision Nutrition and Cancer Program, the Clinical Oncology Group focuses its work on research in patient groups that voluntarily accept to participate in the study of new methods of treating cancer. In general, it is accepted that in the last decades the continuous improvement of the results in the treatment of cancer is due to the realization of clinical trials with new drugs. Similarly, our line of research focused in cancer-oriented nutrigenomics aims to deepen in the knowledge of this pathology by studying highly efficiency products and personalized strategies focused on the implementation of a Precision Nutrition that complements individualized cancer treatments. To do this, we design and carry out clinical trials and nutritional studies that seek to find better ways to prevent, diagnose and treat cancer.

Members:

Dr. Ana María Jiménez Gordo
Oncologist Infanta Sofía University Hospital

Dr. María Sereno Moyano
Oncologist Infanta Sofía University Hospital

Dr. César Gómez Raposo
Oncologist Infanta Sofía University Hospital
Dr. Enrique Casado Sánz
Director of the Medical Oncology Department, Infanta Sofia University Hospital and Oncology Coordinating Professor of Oncology, European University of Madrid
Associate researcher, IMDEA Food
Group leader of the Clinical Oncology Group

Enrique Casado finished his undergraduate studies in Medicine and Surgery (1992) and Biohealth Sciences (1993) in Complutense University of Madrid (Universidad Complutense de Madrid) (UCM). He obtained the Degree of Doctor of Medicine (1994) with Extraordinary Prize granted by UCM. He did his medical residency in La Paz University Hospital (Hospital Universitario de la Paz) (1993-97) and Master’s Degree in Palliative Care (1997) in Universidad Autónoma de Madrid (UAM), in combination with extended postdoctoral internships in University of Alabama (Birmingham) and University of California (San Francisco). He was the attending physician of Medical Oncology in gastrointestinal and thoracic cancer and laboratory coordinator for the Translational Oncology Group of Hospital Universitario de la Paz (Madrid). He is an associate professor of UAM and visiting professor of UCM. He is currently the Director of Medical Oncology Department at the Hospital Universitario Infanta Sofia de Madrid and a Coordinating Professor of Oncology in the Universidad Europea de Madrid. He has received 7 awards in recognition of his research work from institutions as prestigious as the American Society of Clinical Oncology.

Dr. Jaime Feliú Batlle
Director of the Medical Oncology Department, La Paz University Hospital and Professor of Oncology in the Medicine Faculty and Director of Master’s Degree in Palliative Care and Treatments for Cancer Patient Support at Universidad Autónoma de Madrid
Associate researcher, IMDEA Food
Group leader of the Clinical Oncology Group

Dr. Jaime Feliú Batlle holds a Degree in Medicine and Surgery from Universidad Complutense de Madrid issued in 1982. He specialized in Medical Oncology in Hospital Universitario de la Paz, where he is currently the Director of Medical Oncology Department. He is a professor of Oncology in the Medicine Area of Universidad Autónoma de Madrid (UAM) and Director of Master’s Degree in Palliative Care and Treatments for Cancer Patient Support of UAM. Furthermore, he is the current president of the Multidisciplinary Spanish Group of Digestive Cancer (GEMCAD). He has participated as a principal investigator or co-investigator in more than 70 phase I, II and III trials. He has written or co-written more than 200 articles for national and international journals, more than 60 book chapters and has presented a large number of communications in national and international congresses.
Dr. María Sereno Moyano
Oncologist Infanta Sofía University Hospital
Associate researcher, IMDEA Food

María Sereno finished her undergraduate studies in Medicine and Surgery (1999) in Universidad Autónoma de Madrid (UAM). She did her medical residency in La Paz University Hospital (2000-2003) and a Master’s Degree in Palliative Care (1997) in Universidad Autonoma de Madrid (UAM). She obtained the Degree of Doctor of Medicine (2005). She did a postdoctoral internship in Thoracic Program with Prof. S. Antonia in Moffit Comprehensive Cancer Center in South Florida University (Tampa, Florida). She did a Master’s Degree in Molecular Oncology in the Oncology Research National Cancer Institute (2007-2009) in Madrid and another Master’s Degree in Immuno-oncology in Medical Department in Alcalá University (2017). She was the attending physician of Medical Oncology in Gastrointestinal and Thoracic Cancer unit from 2004-2008 and then, she moved to Infanta Sofía University Hospital (San Sebastián de Los Reyes, Madrid), where she is working in Thoracic and Genitourinary Tumors section. She is associate professor in European University of Madrid (UEM) from 3 years ago. She has published several papers and has participated in different translational oncology projects, some of them with public support, as FIS and Plan Nacional.

Dr. César Gómez Raposo
Oncologist Infanta Sofía University Hospital
Associate researcher, IMDEA Food

César Gómez Raposo obtained his Medicine Degree at Universidad Autónoma de Madrid in 2002 and later his Medical Oncology specialty at Hospital Universitario La Paz in 2007. He performed his doctoral thesis (Excellent Cum Laude) in 2012 focused on ovarian cancer. Since 2008 he worked as medical oncologist at Hospital Universitario Infanta Sofía in San Sebastián de los Reyes, mainly in breast and gynecological cancer. As a result of this activity has participated in more than 25 papers published in peer reviewed medical or scientific journals, and has taken part in international clinical trials in breast and gynecological cancer.

Dr. Ana María Jiménez Gordo
Oncologist Infanta Sofía University Hospital
Associate researcher, IMDEA Food

Dr. Ana M. Jiménez Gordo. Graduated in Surgery and Medicine at Universidad Autonoma Madrid (1994). Specialty in Medical Oncology at Hospital Universitario La Paz (1998). PhD in Medicine at Universidad Autonoma Madrid (2004). Master in Palliative Care of Neoplastic Patient at Hospital La Paz (1998). Master in Molecular Oncology at CNIO (2009). Associate Professor in Oncology at Universidad Europea Madrid from 2013. She has worked as Medical Oncologist in Hospital La Paz (1990-2000), Hospital Alcorcón (2000-2005), Hospital Getafe (2005-2013), Hospital Infanta Sofía from 2013. Pfizer Foundation Prize, Clinical Investigation 2012. She has more than 80 national and international publications, congress communications and book chapters. She is member of Spanish Society of Clinical Oncology and has collaborated in several work groups of long cancer survivors, translational investigation, geriatric Oncology and doing some Clinical Guideliness. Recently she collaborates in clinical development of the IMDEA Project “Clinical Formulation por individualized nutrition of cancer patients”.
Molecular Immunonutrition Group
Group leader: Dr. Moisés Laparra Llopis

Objectives: immunonutritional-based precision intervention strategies to a selective and driven modulation of innate immune responses preventing/treating the risk for severity of liver-related diseases and antitumoral response(s).

Cereals, legumes and other grains have been shown to contain several different protease inhibitors, which have been assigned to different families on the basis of amino acid sequence similarities. These molecules play important roles as defensive agents against insects and pests, but also potentially deleterious/beneficial effects in human nutrition and immune function. The latter represent greatest stimulus for Dr. Laparra’s research. Particularly, his research approaches the naturally powerful immunostimulatory property of toll-like receptors (TLRs) agonists for active immunotherapy against liver metabolic dysfunction and cancer promotion. Here, a better understanding and use of the immunonutritional-mediated TLR activation can greatly impact the functional differentiation and polarization of macrophages, as relevant prognostic biomarkers of tissue damage and tumor progression. Additionally, the selective and driven metabolic programming of antigen presenting cells have important roles in the regulation of CD4+T cells priming as well as immune checkpoint blockade. Thereby, preventing effector CD8+T cells exhaustion and longer anti-tumoral response(s).

A clear example is the activation of intestinal innate immune responses via TLR4 by defined non-gluten members of the α-amylase/trypsin inhibitors family, present in wheat endosperm and the source of flour. Besides, Dr. Laparra’s research provided significant contributions demonstrating that defined prebiotic structures modulate TLR4 innate immune responses, but normalizes the plasmatic concentrations of phospholipids, central in the setting of therapeutic effects. Additionally, his research line contributed with effective immunonutritional interventions to promote an anti-inflammatory environment advantageous to CD8+ effector T cells development and reduce hepatic macrophages infiltration. These effects on macrophages, central in coordinating innate immune responses, were associated to changes in the expression of the fatty acid receptor, recently associated to regulation of metastasic penetrance and tumor growth. The extent to which immunonutritional-based modulation can be translated into physiological benefits for large groups of population affected by liver-related diseases is a central objective of this research line.

Members:

Belén García Carrasco
Laboratory technician
Dr. Moisés Laparra Llopis
Group leader of the Molecular Immunonutrition Group

José Moisés Laparra Llopis holds a PhD in Pharmacy gained during his stay at the High Research Council of the Spanish Government. His scientific career is focused on the field of intestinal homeostasis and the crosstalk within gut-liver axis. The novelty and scientific and social impact of his studies was used by the European Food Safety Authority to establish recommendations concerning staple foods. A continuous contact and interaction with internationally renowned research groups constitutes a constant in Dr. Laparra’s career. He held a leading position on prebiotic research awarded by The Fulbright Commission to conduct postdoctoral research in the Food Science Department at Cornell University. Additionally, he participated in teaching activities that end up in a renowned honor thesis awarded by the professional organization for food science and technology professionals in the U.S. This experience favored his incorporation to the Institute of Translational Immunology at the University Medical Center of Mainz University as independent researcher. Dr. Laparra has published over 70 scientific articles and book chapters. He has overseen several precompetitive public funded projects. As senior researcher at IMDEA Food he develops immunonutritional-based precision strategies to tumor suppressor.

Belén García Carrasco
Laboratory technician

Belén García Carrasco is a laboratory technician of clinical diagnosis. From 2007 to 2009 she worked at the Polytechnic University of Agriculture of Madrid, in the Department of Biotechnology, in the group of Gabriel Salcedo and Araceli Díaz Perales, performing techniques such as ELISAs, HPLC, FPLC, PCR, affinity columns, filtration, activation of T lymphocytes and TH1 TH 2 later response and protein purification. In 2009 she joined the group of Prof. Jesús Cruces at the Faculty of Medicine of the UAM, Department of Biochemistry, where she developed the characterization of promoter regions, protein expression in different cell lines, and participated in the development of gene amplification for mutational screening programs. She also has experience in handling laboratory mice, both, maintenance and genotyping, different methods of phenotyping, nucleic acid extraction from tissue or cryopreservation samples. Since 2011 she works at IMDEA Food as a lab technician, implement efforts to support different research groups at both laboratory and administrative.
2.3 Research Program. Precision Nutrition and Cardiometabolic Health

Director: Prof. Alfredo Martínez Hernández

Objectives: this PRECISION Program (Personalized Related Energomics and Cardiometabolomics: interactions Involving Inheritance Obesity and Nutrition) is focused on:

1. Optimize and appraise available resources and databases from Diogenes; Nugenob, Predimed, Worldmethylepigenome and Preview cohorts to better understand genetic and epigenetic outcomes involved in obesity and cardiometabolic adverse traits.

2. Analyze and implement newer metabolic biomarkers with diagnostic, prognostic and therapeutical potential value including the design and definition of Precision Nutrition guidelines.

3. Investigate with global perspectives the interactions including shared mechanisms and triggering common physiopathological pathways among obesity with liver disease and cancer.

4. Integration of nutriomics and metagenomics approaches to understand the phenotipical interactions and responses to specific nutrients and diets involving nutrigenetic and nutrigenomic outcomes.
Cardiometabolic Nutrition Group  
Group leader: Prof. Alfredo Martínez Hernández

Objectives: observational, cross-sectional and longitudinal studies have evidenced that obesity rates and associated complications such as type 2 diabetes, dyslipidemia, liver steatosis and cardiovascular events are continuously rising as a health burden with increasing costs. In this context, subjects elicit variable responses to the dietary intake depending on phenotypical and genotypical factors whose understanding is helping to provide Precision Nutrition management. Nutriomics offer a huge prospect to feature and assess the variety in the reactions to diverse nutritional therapies as well as for medical applications.

Research on candidate genes together with Genome Wide Association Studies (GWAS) and meta-analyses of GWAS have characterized a number of polymorphisms associated with cardiometabolic and liver related adverse features, while nutrigenetics is involved in the recognition of gene-diet interactions, putatively explaining phenotypical differences accompanying food and dietary consumption.

In addition to discover differences associated to the genetic make-up, transcriptomic strategies measuring miRNAs levels have found that the energy intake plus nutrient contents and quality could affect the expression of genes involved in fuel intermediate metabolism, insulin signalling, lipid turnover, and inflammation in different organs and cells such as liver and adipose tissue. Further studies have revealed the occurrence of epigenetic processes (mainly DNA methylation, covalent histone modifications and miRNAs) that may modulate gene functions and participate in nutrition-related diseases and personalized differences.

The investigation of newer metabolomic biomarkers is essential to progress in the evaluation of patient’s metabolic dysfunctions and unhealthy conditions, which will enable to better define health and disease statuses and discriminate responders from non-responders to a given nutritional prescription. Also, metagenomics researches have demonstrated that lifestyle factors such as diet or physical activity can impact intestinal microbiota composition, with possible influence in body weight homeostasis/maintenance, type 2 diabetes, cardiovascular or liver diseases.

Integration in the near future of omics data into Precision Nutrition will allow the implementation of personalised nutritional treatments to prevent and manage chronic diseases and to monitor the individual’s response to novel therapeutical interventions.

Prof. Alfredo Martínez Hernández  
Director of the Nutrition Research Center, University of Navarra  
Professor of Nutrition, Faculty of Pharmacy, University of Navarra  
Associate researcher, IMDEA Food  
Director of the Precision Nutrition and Cardiometabolic Health Program and Group leader of the Cardiometabolic Nutrition Group

Prof J. Alfredo Martínez holds a PhD Nutrition being also PharmD and MD. He is co-IP and has been involved in several landmark intervention trials such as DIOGENES, SEAFOODplus, NUGENOB, FOOD4ME, PREDIMED and PREVIEW, whose results have been published in the most relevant medical and nutritional journals including NEJM, Lancet, Nature, BMJ, AJCN, Obesity, UO, JCEM, Diabetology, Trends in Immunology, TIPS, UO, Cell Metabolism Circulation, etc producing so far more than 20,000 citations. Prof. Martínez has supervised more than seventy PhD students and published more than 600 peer review papers in the areas of Obesity and Nutrition, including precision nutritional omics (H Factor > 60); He has been president of FESNAD and is currently president of ISNN as well as president elect of the International Union of Nutritional Sciences (IUNS) and has been recipient of several important awards including Hipocrates and Dupont prizes. During his scientific career, Prof. J. Alfredo Martínez has enjoyed training or invited stays at Nottingham, Berkeley, MIT, Harvard, Oxford and King College London as well as being reviewer for different EU Committees and Spanish Organizations such as AECOSAN.
Bioactive Ingredients Food Group
Group leader: Prof. Francesco Visioli

Objectives: the Bioactive Ingredients Food Group is being developing a Ministry of Innovation (MICINN) – funded study on the effects of selected phospholipids in models of aging and cognitive decline. In particular, the group is investigating the nutrigenomic effects of phospholipids isolated from buttermilk and krill oil, via innovative technologies developed in the CIAL (UAM + CSIC Madrid campus). Aging represents an important socio-economic issue, in that the European population is rapidly aging and the health care costs associated with this demographic phenomenon are becoming unbearable. Therefore, there is a strong need to find suitable and effective preventive measures, to lessen the burden of disease and decrease budgetary stress. In particular, aging is associated with cognitive decline, which can become severe and develop into dementia and/or Alzheimer’s disease. Given than the brain is the organ richest in lipids (up to 40% in weight), the LabFun thinks it conceivable to supply appropriate phospholipids to maintain and/or restore proper membrane composition, fluidity, and signal transduction. The preliminary results do demonstrate the provision of food-derived phospholipids (formulated through original techniques) are able to ameliorate the synaptic machinery and restore adequate mitochondrial function.

The group employs in vitro and in vivo (including human) approaches to create strong and solid scientific data and foster the formulation of evidence-based nutraceuticals and functional foods. In addition, the group keeps publishing the results of former projects along with reviews on specific topics, therefore enjoying a strong publication record.

**Prof. Francesco Visioli**  
Group leader of the Bioactive Ingredients Food Group

Francesco Visioli’s current concerns essential fatty acids, namely those of the omega 3 series and polyphenols, as related to cardiometabolism and cognitive decline. His research ranges from in vitro studies of bioactivity (test tubes, cell cultures) to in vivo tests, performed on laboratory animals and/or humans. Dr. Visioli has a publication record of approximately 250 papers and book chapters, which have been cited over 9,000 times. He gave invited lectures in over 80 meetings. Dr. Visioli is the Editor-in-Chief of PharmaNutrition, the Leader of the Fats and Human Health division of Eurofed Lipid, and member of the EFSA GMO Panel.

---

**Dr. Emma Burgos Ramos**  
Postdoctoral researcher

Dr. Emma Burgos Ramos got her degree and PhD in Biology from the UAH (2006). For five years, she worked as a postdoctoral researcher at the Laboratory of Endocrinology and Nutrition in HIUNJ. She enjoyed postdoctoral stays at the Universidad Clínica de Navarra and also at the Edison Biotechnology Institute in Ohio University. In 2013, she was incorporated to stem cells and cancer group at the CNIO. In late 2014, she joined IMDEA Food Institute as a postdoctoral researcher at the Bioactive Ingredients Food Group led by Prof. Francesco Visioli, where she is evaluating the effects of polyphenols from extra virgin extra olive oil and other micronutrients on cognitive decline and Alzheimer’s disease. Since 2015, she is an associate professor at the Faculty of Environment Sciences and Biochemistry in UCLM. She has published 6 book chapters and 24 articles in international journals of high impact factor related to neurosciences, endocrinology, metabolism and nutrition.

---

**Dr. João Tiago Estevao Tomé Carneiro**  
Postdoctoral researcher

The research carried out by Dr. João Tiago Estevao Tomé Carneiro has been focusing on the biological activity of food constituents in chronic pathologies. He has a degree in biochemistry and he obtained his PhD at the University of Murcia working at CEBAS-CSIC (2013). He is the co-author of 15 peer-reviewed papers in relevant international journals. In 2014, he joined the Bioactive Ingredients Food Group at IMDEA Food, where he contributes to the assessment of the potential health effects of bioactive food components in vitro, in vivo and through placebo-controlled, randomized clinical trials. He is currently participating in a research project focused on evaluating if the consumption of bioactive phospholipids, as part of a nutritional supplement, contributes to the improvement or delaying of mild cognitive impairment and its correlation with different biological, clinical or neuropsychological biomarkers.

---

**Carmen Crespo Lorenzo**  
Predoctoral researcher

Mª del Carmen Crespo Lorenzo has a degree in Molecular and Cellular Biology from the IE University of Segovia (2010). In 2013 she obtained a Master degree in pharmacological research from the UAM. As part of her research activity, she was part of the research project team “Genetic and genomic analysis in patients affected by Gorham-Stout Disease and General Lymphatic Anomalies” at the Hospital Universitario La Paz. In June 2014, she began her Ph.D. program at IMDEA’s Bioactive Ingredients Food Group. She is playing a relevant part in nutrigenomic and epigenetic projects with different micronutrients (e.g. Hydroxytyrosol, bioactive phospholipids) performing in vitro, in vivo and placebo-controlled, randomized trials in healthy volunteers to evaluate the possible beneficial effect that these molecules play on chronic diseases and find their molecular targets, in order to find new therapeutic strategies. Her publication record shows 10 papers.
Epigenetics of Lipid Metabolism Group
Group leader: Dr. Alberto Dávalos Herrera

Objectives: cardiometabolic diseases are the main causes of mortality in the world and excess in the diet is one of the main causes of these human diseases linked to our modern life-style. The objective is to understand how different non-coding RNAs regulate lipid metabolism during states of health and disease, developing new strategies, both pharmacological and dietetic, to modulate their function. Pharmacological or dietary modulation of the activity of non-coding RNAs that, ultimately, regulate the metabolism of lipids lead to the prevention or treatment of cardiometabolic diseases.

The increasing prevalence of chronic diseases has prompted a strategic focus on prevention strategies. While Precision (personalized) Medicine strives to provide ‘the right therapeutic strategy for the right person at the right time’ a distinct approach is needed for disease prevention. Epigenetics of Lipid Metabolism Group also focus on understanding lifestyle modification of the epigenome in order to try to personalize the health of individuals using epigenetics for the development of Precision Nutrition.

This group works to generate new basic knowledge of how non-coding RNAs regulate the metabolism of lipids under physiological and pathological conditions.

To find and evaluate minor dietary components for their ability to modulate the activity of non-coding RNAs associated with the metabolism of lipids. To carry out collaborative projects with the food and pharmaceutical industry to test and develop new dietary supplements or functional foods based on solid scientific knowledge to prevent or treat a variety of lipid metabolism disorders. And, to incorporate the use non-coding RNAs data to develop Precision Nutrition. In this endeavor, the group actively collaborate with many international research groups located at the following institutions: CINVESTAV (Mérida, Mexico), URFJ (Rio de Janeiro, Brasil), IMSERM UMR1011 (Lille, France) and many other national research groups.
Members:
Dr. Maria Jesús Latasa Sada
Postdoctoral researcher
Judit Gil Zamorano
Predoctoral researcher

Visiting researches:
Flavia Brasil Spreafico
University of Rio de Janeiro

Students:
Yolanda Molero Miguel
Ainoa Gómez Díaz
Dr. Alberto Dávalos Herrera  
Group leader of the Epigenetics of Lipid Metabolism Group  

Dr. Alberto Dávalos holds a degree in Pharmacy and Biochemistry by San Marcos University (Lima) and a PhD in Pharmacy by Universidad Complutense de Madrid (Madrid). He has conducted postdoctoral research at the Hospital Ramón y Cajal (Madrid), at Yale University School of Medicine, (New Haven), and at New York University School of Medicine (New York). Dr. Dávalos’s research program focuses in identifying and characterizing new noncoding RNAs (miRNAs, IncRNAs and other type of regulatory RNAs) that regulate lipid metabolism and the effects of minor dietary components (micronutrients) on their expression. Non-coding RNAs have been recognized as critical modulators of cardiovascular system in health and disease. He hopes to: (i) identify new therapeutic strategies through modulating noncoding RNAs levels by the diet or other lifestyle factors to treat dyslipidemia and to prevent atherosclerosis and cardiovascular diseases; and (ii) understand lifestyle modification of the epigenome and personalize the health of individuals using epigenetics (particularly non-coding RNAs) for the development of Precision Nutrition.

Dr. María Jesús Latasa Sada  
Postdoctoral researcher  

Dr. María Jesús Latasa holds a Pharmacy degree by the University of Navarra and a Ph.D. in Pharmacy, Biochemistry and Molecular Biology section, by the University of Alcalá. Throughout all her professional career, her research field has always been the regulation of gene expression on different tissues and systems, as well as in diverse physiopathological conditions. Thus, her work covers several topics, going from the regulation by various hormones and growth factors of the APP gene, implicated in Alzheimer’s disease (IIBM-CSIC-Spain), to gene expression regulation during nervous system development by epigenetic factors (IC and IIBM-CSIC-Spain), and research on the effect of the nutritional state on the regulation of FAS, the central enzyme in lipid synthesis (UCBerkeley-USA). At this moment her scientific interests focus on the effect of diet on the regulation of microRNA and other non-coding RNAs expression. Recently, she has been as well involved in R&D Management activities within the EIT Food.

Judit Gil Zamorano  
Predoctoral researcher  

Judit Gil Zamorano has a degree in Biotechnology from the Universidad Complutense de Madrid (2011). In 2012 was fellow of the program Starts from IMDEA Food, taking part in the study of the mechanism by which the consumption of DHA reduces the risk of cardiovascular disease, and the analysis of miRNAs that modulate this effect. In 2014 she made a practical stay at the National Center for Microbiology (ISCIII) in Spirochetes and special Pathogens Laboratory, carrying out techniques of extraction, purification and sequencing of DNA, as well as PCR and Reverse Line Blotting for determination of pathogens in human blood samples. Now Judit forms part of the team of Dr. Alberto Dávalos as predoctoral researcher, where she is developing a project based on the screening and characterization of miRNAs that regulates the metabolism of cholesterol and lipoproteins in the enterocyte, and the effect of minor components of the diet on its expression.
2.4 Research Program. Precision Nutrition and Aging

**Director:** Dr. Manuel Serrano Marugán

**Objectives:** the recently created Precision Nutrition and Aging Program at IMDEA Food is focused on the molecular and physiological effects that nutrition exerts on the process of aging. Since aging is a complex, multi-organ degenerative process strongly influenced by the genetic background and the environment, our research covers a wide range of biological topics: from the discovery and development of new bioactive products active against aging-related pathologies, to the dissection of different molecular pathways involved in degenerative pathologies, or the study of nutritional interventions with anti-aging properties, such as fasting or calorie restriction.

Headed by Dr. Manuel Serrano, one of the most prestigious Spanish scientist in the fields of aging and cancer, the Precision Nutrition and Aging Department is intensely expanding at the moment. Recently, it has incorporated another of the worldwide best-known aging scientist, Dr. Rafael de Cabo, from the National Institute of Aging, a reference in the study of calorie restriction as a nutritional intervention to lengthen lifespan. Along with these two very important figures, the group of Dr. Pablo J. Fernandez Marcos, focused on nutritional interventions (bioactive products, fasting) to fight obesity, diabetes and aging, form the program.
Dr. Manuel Serrano Marugán
Director of the Tumour Suppression Group and Director of the Molecular Oncology Program, Spanish National Cancer Research Center
Associate researcher, IMDEA Food
Director of the Precision Nutrition and Aging Program

Manuel Serrano is a researcher at the Spanish National Cancer Research Centre (CNIO), in Madrid, and Director of the Molecular Oncology Program of the CNIO. After completing his studies and PhD in Madrid, M.S. joined the laboratory of David Beach, at Cold Spring Harbor Laboratory, NY, USA, as postdoctoral fellow from 1992 to 1996. During this time, Manuel Serrano made one of his most important contributions with the discovery of the tumour suppressor p16. Manuel Serrano established his research group, first at the National Center of Biotechnology, Madrid, and since 2003 at the CNIO. The main contributions of the Serrano’s laboratory during these years are related to the concept of oncogene-induced senescence and the anti-aging activity of tumor suppressors. More recently, Serrano’s group has reported on the relevance of tumor suppressors in metabolic Syndrome, the existence of senescence during embryonic development, and the feasibility of embryonic reprogramming within alive adult organisms (the latter was considered “Achievement of the Year 2013” in the stem cells field by Nature Medicine). The unifying theme of Manuel Serrano’s research is to understand and manipulate cellular stress responses in relation to cancer and regeneration.
Metabolic Syndrome Group

Group leader: Dr. Pablo José Fernández Marcos

Objectives: Metabolic syndrome (MS) is a group of pathologies caused by a prolonged imbalance between energy intake and expenditure, and is strongly related to the degenerative process of aging. The main MS-associated pathologies are obesity, diabetes, cardiovascular diseases and cancer, which makes MS one of the main health challenges of developed countries.

This research group is focused on the study and development of nutritional interventions to fight MS and aging. More precisely, we are focused on two main research lines: characterization and development of new bioactive products with evidences of metabolic activity, for which no molecular mechanism is yet known; and the study of the beneficial effects and applications of fasting as a powerful nutritional intervention.

For the first line, we will analyze a battery of pure compounds and extracts from different natural sources, and will measure their effects on essential metabolic processes in obesity and diabetes development, such as insulin signaling, mitochondrial activity, the pentose phosphate pathway or brown fat thermogenesis. Once safety and effectivity of these bioactive products are checked on mice, we can start designing nutritional assays on human volunteers, taking advantage of the nutrigenomic platform at IMDEA Food.

For the second research line, we are currently studying the ability of fasting to enhance anti-cancer chemotherapy treatment, in two ways: first, fasting protects from chemotherapy toxicity; second, fasting potentiates anti-tumor immune responses.

Dr. Marta Barradas Solas  
**Postdoctoral researcher**

Marta Barradas joined Manuel Serrano’s lab at Centro Nacional de Biotecnología (Madrid) in 1997, where she obtained her PhD in the characterization of Ras-induced senescence in primary cells. In 2003 she moved to UK, where she was working as a postdoctoral researcher in several laboratories. First, in Fiona Watt’s lab at London Research and Cambridge Research Institutes, studying the role of catenin signalling in skin cancer. Then in 2008, she moved to Jesús Gil’s lab at the MRC-CSC (London), where she studied the interplay between epigenetics and cancer. In 2011 she moved back to Spain to work in the Cell Signalling Therapies lab of EliLilly at Centro Investigaciones Oncológicas, CNIO (Madrid), where she focused on the validation of new metabolic targets for cancer therapy. After a brief stay in the Brain Metastasis Group at CNIO, in December 2015 she joined the Metabolic Syndrome Group at IMDEA Food Institute.

Luís Filipe Costa Machado  
**Predoctoral researcher**

Luís Filipe Costa Machado has a bachelor degree in Pharmacy (2014) and a master’s degree in Biomedical Research (2015) both from the University of Santiago de Compostela. In March 2013, he joined the group of neuropharmacology at the University of Bath (UK) where he worked in a research project focused on the study of the genetic bases of depression. During the last months of his undergrad, he also worked at the group of Oncology and Cell Cycle at the Center for Molecular Medicine and Chronic Diseases (CIMUS), to study the role of the transcription factor E2F in neuronal stem cells. During his master’s research project, he joined the group of Stem Cells in Cancer and Aging at the Health Research Institute of Santiago de Compostela (IDIS) where he was responsible for the development of high-throughput methods to identify new senescence inducing compounds in tumor cells. In December 2015, he joined Dr. Pablo Fernández group, as a predoctoral researcher, in order to study new approaches to understand and treat metabolic disorders.
Nutritional Interventions Group

Group leader: Dr. Rafael de Cabo

Objectives: The Nutritional Interventions Group applies the knowledge gained in model organisms to translate nutritional interventions to improve or delay the decline of function that occurs with aging. We utilize whole body physiological and tissue-specific molecular approaches to investigate effects of nutritional interventions on basic mechanisms of aging and age-related diseases.

Dr. Rafael de Cabo
Chief of the Translational Gerontology Branch, National Institute on Aging (NIH) (USA)
Associate researcher, IMDEA Food
Group leader of the Nutritional Interventions Group

Rafael de Cabo, PhD is currently the chief of the Translational Gerontology Branch at the National Institute on Aging in Baltimore, Maryland. A native of Cordoba, Spain, he received his B.S. from the University of Cordoba, and his Ph.D. in 2000 from the Department of Foods and Nutrition at Purdue University. Upon completion of his graduate education, he trained as a postdoctoral fellow in the Laboratory of Neurosciences at the National Institute on Aging in Baltimore, Maryland. In 2004, he was appointed as a tenure track investigator in the Laboratory of Experimental Gerontology. His group applies both physiological and tissue-specific molecular approaches to investigate effects of nutritional interventions on basic mechanisms of aging and age-related diseases. Research within his unit strives to identify protective mechanisms invoked by caloric restriction and to evaluate the consequences of dietary interventions on lifespan, pathology, and behavioral function. Dr. de Cabo’s research balances the exploration of in vivo rodent, as well as in vitro, paradigms of caloric restriction.
2.5 Research Program. Food Products for Precision Nutrition

Director: Prof. Guillermo Reglero Rada

Objectives: The main purpose of this line is to connect with the food industry, building a bridge between molecular mechanistic research and the market through the development of food products for specific health use which either respond to the results generated by the most basic lines of the Institute or are validated using the scientific tools of said lines.

This group is based mainly on human resources and infrastructures outside IMDEA Food provided by Universidad Autónoma de Madrid. For this reason, the Institute has signed a collaboration agreement and, more specifically, within the context of Biocampus Norte de Madrid (BUC) developed by Universidad Autónoma and in which IMDEA Food is integrated, along with other public research centers and companies in the biomedicine sector.

Members:

Dr. Clara Ibáñez Ruiz  
Postdoctoral researcher

Dr. María Tabernero Uribieta  
Postdoctoral researcher

Lamia Mouhid Al Achbili  
Predoctoral researcher

Mónica Gómez Patiño  
Laboratory technician

Students:

Azucena Martín Olmos

Daniela Pingarrón Cárdenas
Clara Ibáñez Ruiz received her PhD in Chemistry with International Mention from the University of Alcalá (UAH) in 2013. Her thesis was awarded with the special mention by the UAH and for the Best Doctoral Thesis in Analytical Methods in Biochemistry (Prize Juan Abelló Pascual II) by the Royal Academy of Doctors of Spain. Her scientific career has been primarily focused on the development and application of metabolomic strategies directed towards the search for metabolic biomarkers related to the onset and/or development of different diseases, diagnosis, and preventive effect of food ingredients. She currently works in the IMDEA Food Institute as a postdoctoral researcher with a Juan de la Cierva contract. Her scientific work is reflected in more than 30 publications and in the dissemination of results in more than 30 congresses.

Dr. María Tabernero Urbieta
Postdoctoral researcher

Dr. María Tabernero holds a Biology degree by the University of Salamanca and a PhD in Biochemistry and Molecular Biology by the Universidad Complutense of Madrid. Her professional career combines multidisciplinary research experience in some of the leading global Food Companies (Unilever Research –The Netherlands- and Kraft, currently Mondelēz–France) and public research centers (ICTAN-CSIC and the Hospital La Paz Institute for Health Research). She has been awarded with two Marie Curie Fellowships which have allowed her develop her research in the topic of physiological validation of bioactive ingredients and functional foods. She is currently part of an ILSI-Europe taskforce group of experts and is actively involved in the European Project EIT-Food. She joined IMDEA Food in September 2016 as a postdoctoral researcher applying food technology and nutritional sciences for the promotion of health.

Prof. Guillermo Reglero Rada
IMDEA Food Director and Director of the Food Products for Precision Nutrition Program

Guillermo J. Reglero Rada, PhD in Chemistry (1985). Full Professor of Food Sciences at the University Autónoma de Madrid (1999) and Senior Researcher of Consejo Superior de Investigaciones Científicas, CSIC (on leave). Between 1993 and 1994 he worked as Technical of Industrial Projects for Centro para el Desarrollo Tecnológico Industrial (CDTI). Between 2002 and 2006 he was the Manager of the Food Science and Technology Program of the National Plan of R&D. Between 2005 and 2010 he was a member of the Steering Committee of the UAM-CSIC Instituto de Investigación en Ciencias de la Alimentación, CIAL. Currently he is the Director of IMDEA Food Institute. He works in a research group on food and health. He has directed 6 projects of the National Plan of R&D, 3 projects of industrial R&D Innpacto and 70 projects in collaboration with companies. Since 2005 he has coordinated a Program of Activities in Technology funded in three calls for the Comunidad de Madrid and composed of groups of 10 research centers and hospitals. He has participated in projects of the EU Framework Program, as well as Consolider and Cenit Ingenio 2010 Programs. Currently he is involved in 3 projects of the Strategic National Consortia Program Research (CIEN). He is author over 250 publications of international impact and 3 licensed patents in exploitation. In 2001 he received the Award of the American Oil Chemists Society and in 2008 the Prize of the Spanish Society of Gastrononía as Best Spanish Researcher in Food Science and in 2015 the Fundación García Cabrero Award to the Invention.
Lamia Mouhid Al Achbili  
Predoctoral researcher

Lamia Mouhid obtained her Biotechnology degree at the University of Lleida in 2010, a Master in Administration and Innovation in the Food Industry at the same university, and a Master in Pharmacology at the University Autónoma de Madrid. During 2010 and 2011 she worked at the R&D department in a private company, where she developed a fermented beverage from fruit juice. In 2012, she worked in a pharmaceutical company and in 2013 at La Princesa Hospital and at the University of Montreal, where she studied molecular mechanisms associated with neurodegenerative diseases and the efficacy of neuroprotective drugs. In November 2014, Lamia joined IMDEA Food as a predoctoral researcher, where she is currently developing customized nutritional products for patients with gastric cancer.

Mónica Gómez Patiño  
Laboratory Technician

Mónica Gómez Patiño is a senior technician in Analysis and Chemical and Microbiological Control as well as specialist in Instrumental Analysis Techniques. She is currently finishing the degree in Chemistry. She has professional experience in the field of pharmaceutics working in private companies such as Qualicaps Europe and BioMerieux. She also worked in Spain ALK performing various experimental procedures in the field of Biochemistry, using different techniques for the identification, quantification and detection of specific proteins as well as immunology related techniques for the investigation of respiratory diseases. She has five years of experience in Chromatographic Techniques, acquired in different research centers such as the Institute for Research and Agricultural and Food Technology (INIA) and the Center for Biological Research (Higher Council for Scientific Research (CSIC)). She currently works in the IMDEA Food Institute, as a laboratory technician, supporting Food Products for Precision Nutrition Program and the Platform GENYAL and she is also the Director of Biosafety of the Institute. Her contract is funded by the European Social Foundation State Program of Talent People Promotion from the State Plan of Scientific and Techno cal and Innovation Research.
2.6 Research Platform. Platform for Clinical Trials in Nutrition and Health. GENYAL

General Director: Prof. Guillermo Reglero Rada
Scientific Director: Dr. Ana Ramírez de Molina
Administrative Director: Inmaculada Galindo Fernández

The Platform for Clinical Trials in Nutrition and Health (GENYAL) constitutes a high-throughput genomic tool with high scientific level useful to investigate how individual human genomes interact with diet constituents and these in turn with the genome. The results of the research provide information about the benefits and harms of specific nutrients and food ingredients on the human health. The application includes both basic and applied research related to gene-diet health at the two fields, Nutrigenetic and Nutrigenomic.

GENYAL caters Spanish and foreign research groups working on nutritional genomics, as well as food industry companies, interested in:

- Nutritional intervention studies required for product development or for obtaining official approval of the nutritional and health claims made for products.
- The generation of the information needed to provide added value to new and existing products (e.g., the identification of new indications).
- The identification of (mainly) genetic or metabolic markers involved in the response to product consumption.

The Platform focuses its activity on two areas:

1. Nutritional intervention studies to validate the effect of functional foods and food supplements on the general population and by genotypes.

To date more than twenty nutritional intervention studies have been performed to evaluate effectiveness of:

- Prepared dishes enriched with artichoke, olive and grape on overweight and obese people.
- Functional drink enriched with antioxidants on healthy people.
- Functional biscuits enriched with an olive extract on overweight and obese people.
- Olive, apple and grape extracts on people suffering the metabolic syndrome.
- Daily intake of a functional jam enriched with a pomegranate extract on postmenopausal healthy women.
- Daily intake of a functional Mediterranean drink on healthy subjects presenting risk factors for chronic diseases development.
- Formulation of products for personalized nutrition of patients with gastric cancer.
- Interactions between gut microbiota, genotype and dietary polyphenols, in normal-weight, overweight and obese healthy adults.
- Genotypic and phenotypic characterization of patients suffering multiple chemical sensitivity syndrome (MCS) and associated chronic fatigue syndrome (SFC).
2. Permanent recruitment of volunteers.

GENYAL also has a program for characterising the phenotypes and genotypes within populations, allowing a cohort Platform to be constructed for use in clinical trials on nutrition and health. The main objective is to identify and characterize gene variants associated with different responses to nutrients and studying the effects of foods and food constituents on gene expression. Phenotype characterisation includes the gathering of socio-health data, physical activity profiles, anthropometric information and the results of biochemical analyses; genotype characterisation involves the identification of variants (nucleotide polymorphisms and SNPs) of genes involved in nutrient metabolism and nutrition-linked disease. Volunteers are being permanently recruited and as of now more than 1.500 people have been genotypically and phenotypically characterized.

The Platform has its own ethics committee and provides advanced scientific services to researchers and companies via three IMDEA research Units:

- The Nutrition and Clinical Trials Unit
- The Biostatistics and Bioinformatics Unit
- And the Genomics Laboratory

In addition, GENYAL performs functions of specialized training and provide support in the transfer of results, dissemination, communication and outreach.
2.6.1. Nutrition and Clinical Trials Unit

Group leader: Dr. Viviana Loria Kohen

The Nutritional and Clinical Trials Unit undertakes nutritional intervention studies designed to assess the biological activity and health properties of functional foods/bioactive compounds and diets in humans. Both observational and clinical intervention studies involving healthy subjects and those with pathologies can be performed.

The Unit has an intervention/extraction room, two nutritional consultation offices, a room for short-term monitoring, and a room for discussions and conferences on nutritional education.

An independent ethics committee ensures that the rights, safety and wellbeing of trial participants are upheld, by taking into account the methodology of proposed trials, their ethical and legal aspects, and the balance between risks and benefits. This committee is formed by professionals of recognized prestige and experience in research.

Members:

Dr. Rocío de la Iglesia González
Senior nutritionist

Elena Aguilar Aguilar
Senior nutritionist

Isabel Espinosa Salinas
Senior nutritionist

Helena Marcos Pasero
Nutritionist, predoctoral researcher

Students:

Virginia Murillo Guadalix

Fernando Aguilón Martín
Isabel Estévez Martínez
Amarcay Ortega López
Helena Marcos Pasero
Alicia Zaragoza Córdoba
Dr. Viviana Loria Kohen
Nutritionist, senior researcher and Group leader of the Nutrition and Clinical Trials Unit

Dr. Viviana Loria Kohen obtained her Bachelor’s degree in Nutrition at Universidad de Buenos Aires, UBA (1996) and completed a Postgraduate Program in Nutrition (1996-1999) (training program similar to MIR in Spain). While living in Spain, she earned a Master’s degree in Clinical Nutrition at Universidad Autónoma de Madrid, UAM (2001). Thereafter, she obtained her PhD in Medicine at UAM in 2010. In 2004 she joined the Fundación Biomédica of the Hospital Universitario La Paz (FIHULP) staff, taking part of the Research Group in Nutrition and Functional Foods, IDipaz. In March 2012, she joined IMDEA Food and currently, she is Group leader of the Nutrition and Clinical Trials Unit at IMDEA Food. She has authored nutrition education books and has co-authored 27 books. Moreover, she has published more than 50 papers in scientific journals and has presented 85 communications and papers in national and international conferences. She has been professor in Human Nutrition and Dietetics at Escuela de Nutricionistas UBA and participated in teaching activities for the Universidad Nacional de Educación a Distancia (UNED). She is nowadays tutor of practices in UAM and UCM.

Dr. Rocío de la Iglesia González
Senior nutritionist

Dr. Rocío de la Iglesia is BSc in Human Nutrition and Dietetics (UAM, 2008), MSc in Nutrition and Metabolism (UNAV, 2009) and PhD in Food Science, Physiology and Health (UNAV, 2014). She received the Final Master of Higher Scientific Quality Award for her work in the field of a new generation of food for weight management and obesity prevention (CENIT PRONAOS project). During the PhD studies, she specialized in the implementation of clinical trials examining the health effects of different dietary components. This PhD included a period in the HS Nutrition Unit at the University of Reading (U.K) which lead her to obtain the International Doctor Mention. Moreover, she has university teaching experience in the degrees of Pharmacy and Human Nutrition and Dietetics (positive evaluation from ANECA as assistant professor). She has worked on 13 R&D projects, she has co-authored 19 publications and she has presented different communications in national and international congresses.

Elena Aguilar Aguilar
Senior nutritionist

Elena Aguilar Aguilar has a degree in Human Nutrition and Dietetics and a Masters in Food Science and Technology obtained at Universidad Complutense de Madrid (UCM). Currently she’s studying her PhD in Nutrition Project at Department of Nutrition and Food Science I of Pharmacology Faculty at UCM. Her work activity has been developed both in research and in the healthcare field and teaching. She was a member of the Research Group in Nutrition and Functional Foods (NUTRINVEST) of Research Institute of University Hospital La Paz (IdiPAZ) and she worked as a nutritionist at University Hospital Santa Cristina in Madrid. She had a placement as a teacher and a tutor in some courses and masters. Likewise, she has written some book chapters and contents for subjects of a degree and postgraduate courses. She has joined on September 2015 to the IMDEA Food Research Institute as a Senior Nutritionist.
Isabel Espinosa Salinas
Senior nutritionist

Isabel Espinosa Salinas holds a Bachelor of Science degree in Food Science and Technology (2006) and a degree in Human Nutrition and Diet (2004) from Universidad Autónoma de Madrid. She has been involved in Endocrinology and Nutrition Department of “La Paz” and “Puerta de Hierro” Hospitals. She collaborated with Mahou-San Miguel Group for the development of a health and nutrition program in several cities around Spain. In 2010, she joined IMDEA Food and worked on the set up and development of the Platform for Clinical Trials in Nutrition and Health GENYAL. At present, she has more than seven years of experience as nutritionist in the development of more than 15 clinical trials funded by National Projects grantee and in nutritional intervention studies for companies as Biosearch Life or Capsa Food among others. She has teaching experience in nutrition courses and workshops. She has co-authored several publications, classroom books for Fundación Universitaria Iberoamericana and she has also presented different communications in national and international congresses.

Helena Marcos Pasero
Nutritionist, predoctoral researcher

Helena Marcos Pasero has a degree in Human Nutrition and Dietetics from the Universidad Autónoma de Madrid (2010-2014). She completed the interuniversity Master’s Degree “NUTRENVIGEN-G + D Factors” in Genetic, Nutritional and Environmental Conditions of Growth and Development from the Universidad de Granada (2015-2016). In 2014 she joined Platform for Clinical Trials in Nutrition and Health GENYAL at IMDEA Food Institute as a Nutritionist, where she collaborates on the development of several clinical trials related to nutrition and genetics. Currently she’s studying her PhD in Food Sciences from Universidad Autónoma de Madrid, following the Nutrition Genomics line of research.
2.6.2. Biostatistics and Bioinformatics Unit

The Unit provides resources and personnel specialized in the analysis of phenotype-genotype associations, the identification of biomarkers, the analysis of gene expression microarray data, real time PCR analysis, the functional analysis of differential expression results, and those obtained by next generation sequencing, etc.

A project control web application has been developed for storing and processing data and monitoring samples pertaining to different nutrition research projects. This application, designed by the IMDEA Food Institute and which uses open source software, can store and manage a large volume of phenotype and genotype data. It also holds anthropometric, medical and biochemical data, as well as validated nutritional questionnaires that can be filled in on-line (greatly facilitating data entry). The recruitment process can also be managed using this application. The entire system dissociates/anonymises all data in keeping with Spanish privacy legislation (Ley Orgánica 15/1999 de 13 de diciembre de Protección de Datos de Carácter Personal).

The Unit organizes specialized training courses and collaborates with the postgraduate program of the Universidad Autónoma de Madrid.

Members:

Jesús Herranz Valera
*Biostatistician, senior researcher*

Roberto Martín Hernández
*Bioinformatic, predoctoral researcher*
Jesús Herranz Valera
Biostatistician, senior researcher

Jesús Herranz obtained his degree in Mathematical and Statistical Sciences at the University of Granada. He has worked as Biostatistician to the research Unit of the Clinic Hospital San Carlos in Madrid, in the Molecular Discovery Research GlaxoSmithKline’s Basic Research Center in Tres Cantos, and the Molecular and Genetic Epidemiology Group of the Spanish National Cancer Research Center (CNIO). The main research interests of Jesús Herranz are focused on the gene-gene interactions analysis in the GWAS setting, the application of the data mining and statistical learning techniques to genetic data and the extension of these techniques to survival data. He has been Assistant Teacher in the Faculty of Mathematical of the Complutense University of Madrid. Now, he is teaching courses of statistics applied to the biomedical research with R software.

Roberto Martín Hernández
Bioinformatic, predoctoral researcher

Roberto Martín Hernández obtained his Master’s Degree of Science in Biochemistry and Biotechnologies at the Université Paul Sabatier (Toulouse, France). He worked as a trainee scientist at Bayer CropScience division (Lyon, France) developing enzymatic assays for high throughput applications. In March 2008 he joined the Computers Architecture Department of the Universidad Complutense de Madrid (Spain) and started to work in the statistical analysis of biological data generated by high throughput technologies. Afterwards he joined the R&D Department of the bioinformatics startup Integromics (Madrid, Spain), where he continued working on massive data analysis generated by transcriptomics and genomics platforms, and he contributed to the development of professional software packages which are still commercialized. He joined the IMDEA Food research Institute on May 2012. With an 8 years’ experience in bioinformatics and computational biology, he has co-authored 15 scientific research articles published in international journals. His scientific interests focus on data mining, data integration and deep learning. In addition he is completing the UAM (Madrid) PhD program in Nutrition science as a part-time student.
2.6.3. Genomics Laboratory

Lab manager: Dr. Susana Molina Arranz

The Genomics Laboratory has the necessary infrastructure for providing genetic and genomic services, as well as metabolomic analysis, providing technical and scientific support to researchers and private companies.

This Laboratory is equipped with appropriate devices for sample processing and nucleic acid extraction and quantification, as well as the latest hardware for gene expression and high performance genotyping analysis, such as the latest generation QuantStudio™ apparatus. These devices have different applications, such as digital PCR, DNA fragment analysis, expression/gene quantification analysis, allele discrimination using TaqMan probes, and the detection of SNPs and mutations, etc. In addition, the laboratory has specific equipment for analyzing metabolites (HPLC, Seahorse, Magpix), a high value added tool in nutrigenomic and nutrigenetic studies, to achieve effective Precision Nutrition”.

Members:

Elena García Carrascosa  
Laboratory technician

Mónica Gómez Patiño  
Laboratory technician

International Affairs:

Dr. Han Joosten  
Senior researcher
Dr. Susana Molina Arranz  
Technical responsible of the Genomic Laboratory

Susana Molina Arranz, performed her PhD studies in the group of Prof. Luis Carrasco at the “Centro de Biología Molecular Severo Ochoa” (CSIC-UAM). In 2007 she joined Dr. Juan M. Torres group at “Centro de Investigación en Sanidad Animal” (INIA), a research group about prion diseases and its strain barriers. Between 2008 and 2009 she joined the group of Fernando Valdivieso at the “Centro de Biología Molecular Severo Ochoa” (CSIC-UAM), working as a technician generating biological tools for the therapeutic investigation of Alzheimer Disease. During all these years she acquired experience in cell culture, as well as different techniques in molecular biology as western blotting, cloning, and nucleic acid and protein purifications. In 2009 started in IMDEA Food as the Technical responsible of the Genomic Laboratory, working both in the investigation line about nutritional genomics of cancer, as well as in GENYAL Nutrigenomic Laboratory. Her work in the GENYAL Platform includes processing and analyzing samples from the different intervention studies that are developing in IMDEA Food, but also from external companies and research centers interested in genotyping studies.

Elena García Carrascosa  
Laboratory technician

Elena García Carrascosa obtained her Biology Degree in 2013 at Complutense University in Madrid specializing in Health Biology, in 2013 she made a practical stay at the Clinical Analysis Laboratory of Hospital General Mancha Centro. Meanwhile, she joined Biosearch Life as a student in practice, she took part in the characterization of probiotic bacteria in breast milk samples. In February 2016, she joined IMDEA Food Institute where she is working in GENYAL Platform as a research assistant.

Dr. Han Joosten  
Senior researcher

Han Joosten studied Biology at the Radboud University of Nijmegen (the Netherlands) and obtained a PhD degree at Wageningen University in 1988 based on his research on the formation of biogenic amines in cheese that was carried out at the Netherlands Institute for Dairy Research (NIZO). After a post-doc at the Autonomous University of Madrid (1989-1991) in the group of Dr. Eladio Viñuela he joined the leading Dutch dairy company Coberco as Director of the microbiology laboratory in Deventer. From 1994 to 1996 he worked as a research scientist at the CIT-INIA in Madrid on the application of a bacteriocin producing starter culture in dairy products. From 1996 until early 2015 he was employed by Nestlé at the central research facility in Lausanne, Switzerland. During this period he has been active in the development of methods for microbiological analysis of foods and safety assessments of food products and processing methods. In 2012 Han Joosten was nominated as professor at Wageningen University where he holds the European Chair in Food Safety Microbiology. In October 2015 he joined GENYAL Platform at IMDEA Food Institute as a senior scientist.
2.7 Research Platform. Nutrigenomics Interactive Center. CIN

The Nutrigenomics Interactive Centre (CIN) is an initiative of the IMDEA Food Institute, the aim of which is to disseminate the Institute’s research results.

Currently the CIN presents its exhibition entitled ‘SNP: Salud y Nutrición Personalizada’, i.e., “Health and Personalised Nutrition” the aims of which are to:

- Familiarize society at the school, family and business level, of the aims of research into nutritional genomics.
- To transmit the idea of the importance of nutrition in human health and the relationship between genetics and the effects of food on health.
- To explain different traits of personalised nutrition: emotional, chronobiological and social.

Via scientifically validated interactive surveys, the exhibition allows visitors to understand their degree of adherence to the Mediterranean Diet, their chronotype, and the involvement of their emotions in their food choices. Visitors acquire knowledge about themselves, their biology, their emotions and their current habits, and how they can use this information to follow a more healthy lifestyle.

The exhibition is divided into 6 areas:

A1: Evolution and diet
A2: Diet and health
A3: Healthy living
A4: The Mediterranean Diet
A5: At the supermarket
A6: In the laboratory
A1: Evolution and diet

This area shows the visitor how our diet has changed since the time of Australopithecus until that of Homo sapiens, and how the evolution of the diet has been inexorably linked to that of our species.

A2: Diet and health

This area teaches the visitor about how diet influences health. Traditionally, foods have been thought of as sources of energy and construction materials required by our cells so that they can undertake their functions. However, we now know that the diet plays an essential role in the regulation of gene expression. When genes are appropriately expressed, they help us maintain our bodies in perfect equilibrium. A strong diversion from the optimum, however, could lead to disease.

A3: Healthy living

In this section, the visitor will learn about the key elements of a healthy lifestyle and will be able to experience some of them as part of the interactive experience. The role of physical activity on health is well known, but less is known about how our emotions influence our food choices and how our mood is in turn affected by our diet, or how our internal clock works and should be synchronized with our diet to prevent chronic diseases.

A4: The Mediterranean Diet

The Mediterranean Diet is a great Spanish heritage, which, in 2010, was declared a World Intangible Cultural Heritage by UNESCO. We therefore have one of the best ways of maintaining health right before our eyes. But do people know what makes up the Mediterranean Diet? And is the diet we follow Mediterranean? The visitor can here learn the answers to these questions, as well as others on this diet.

A5: At the supermarket

Here visitors can use their newly acquired knowledge in a virtual food shopping scenario. The aim is to teach people responsible, personalised healthy food shopping.
A6: In the laboratory

This area recounts the history of research into nutrition, and describes the research work of the IMDEA Food Institute. A laboratory bench allows visitors to ‘be’ scientists, and to extract their own DNA. Audiovisual aids explain the make-up of the Institute and what some of our installation’s equipment is for.

Temporary workshops and exhibitions

The CIN also sets up workshops directed towards:

- Schoolchildren - supporting teaching in schools.
- Families - encouraging responsible nutrition at home.
- Nutrition consultants – providing support in the form of training.

The CIN also has temporary exhibitions organized by companies working in nutrition and allied fields.
2.8 Research Platform. The Cooperative R+D+I Laboratory. LACID

The Cooperative R+D+I Activity Laboratory (LACID, according to its Spanish initials) provides a framework for cooperation between the IMDEA Food Institute and the R+D departments of private companies and public research institutes (Spanish and foreign), in which funding, human resources, spaces and infrastructures can be shared for joint R+D+I projects in nutrition and health.

LACID has the objective of bringing together science and the agrifood industry in order to provide better opportunities for improving competitiveness and social wellbeing for the Region of Madrid and indeed the whole of Spain.
3.1 Competitive research projects [61]

3.2 International consortia [65]

3.3 Research grants [67]

3.4 Contracts with companies [69]
3.1 Competitive research projects

**FORCANCER**
Developing products for personalized nutrition of gastric cancer patients

- **Principal investigator:** Dr. Ana Ramírez de Molina
- **Funded by:** Ministerio de Economía y Competitividad
- **Duration:** 2014 - 2016

FORCANCER project aims to exploit the opportunities offered by the current state of knowledge to design and validate effective food products to improve some aspects of cancer. Its objectives are to obtain and characterize functional food ingredients of high bioavailability, combining natural extracts rich in phenolic compounds with alkylglycerols and glycerides as carrier lipids to formulate nutritional supplements and functional foods aimed at reducing the rate of tumor progression and to improve the general condition and response to treatment of colon and pancreatic cancer patients.

**European Projects Bureau MADRIMASD - IMDEA Food (EUC2013-C-50806)**

- **Funded by:** Ministerio de Economía y Competitividad
- **Duration:** 2014 - 2016

The European Research Projects Office is an initiative to promote researchers’ participation in European funding programs. The project is made up of the following institutions: IMDEA Water, IMDEA Food, IMDEA Energy, IMDEA Materials, IMDEA Nanoscience, IMDEA Networks, IMDEA Software and Madri+d Foundation, which coordinates the project.

The European Research Projects Office is responsible for giving support in the application, giving expert advice in project management and informing researchers about funding opportunities.

**ALIBIRD-CM**
Functional Foods and nutritional strategies for the prevention and treatment of chronic diseases. (ALIBIRD III S2013/ABI-2728)

- **Principal investigators:** Dr. Ana Ramírez de Molina (ONCOGENOM) and Dr. Francesco Visioli (GENECO)
- **Funded by:** Consejería de Educación, Juventud y Deporte. Comunidad de Madrid
- **Duration:** 2014 - 2018

A total of 9 research groups of the Community of Madrid are involved in this consortium that aims to advance forward scientific aspects of knowledge needed for the development of high efficacy and security functional foods to contribute to the improvement of the health of populations, and reducing obesity and improving the life of cancer patients.

It also pretends to contribute to the competitiveness of European industry in the food and nutrition area.

**PREDIMED+DM**

Effect of a hypocaloric Mediterranean Diet and physical activity promotion on the prevention of type 2 diabetes mellitus in subjects with the Metabolic Syndrome

Principal investigator: Dr. Lidia Daimiel Ruiz  
Funded by: Instituto de Salud de Carlos III  
Duration: 2015 - 2017

The aim of this project is to evaluate the effect on the incidence of T2DM of an intensive weight loss intervention based on a traditional hypocaloric Mediterranean Diet, physical activity and behavioural therapy, as compared to dietary advice based on a Mediterranean Dietary in the context of usual health care.

The PREDIMED+DM study is impinged in the PREDIMED-PLUS study, a randomized clinical trial evaluating the effect of same therapeutic strategies used in our study but on primary prevention of cardiovascular disease in overweight/obese subjects with the metabolic syndrome.

**PHOSPHOLIPIDS4COGNITION**

Evaluation of a nutritional supplement enriched with bioactive phospholipids designed to prevent age-associate mild cognitive impairment

Principal investigator: Dr. Javier Fontecha Alonso (CIAL, CSIC-UAM)  
IMDEA Food participant investigator: Dr. Francesco Visioli  
Funded by: Ministerio de Economía y Competitividad  
Duration: 2015 - 2018

Cognitive impairment (IC) associate with age (Age-related cognitive decline -ARCD) is one of the great challenges of our society today due to the aging population, which is a serious social and family problem, as well as a great difficulty for national health systems. Since currently available pharmacological treatments are not effective in preventing IC, are been promoted multidisciplinary strategies related to the prevention of chronic diseases associate with aging. Both the R+D+I and the H2020 include multidisciplinary lines in order to improve the understanding, prevention, early diagnosis and treatment of mental conditions and disorders of the elderly. PHOSPHOLIPIDS4COGNITION raises the approach of a coordinated multidisciplinary project, whose overall objective is to investigate the effect of the intake of PLs bioactives (of dairy and marine origin) in the prevention and treatment of cognitive impairment associate with aging, using a preclinical study with aged rats and a clinical study in a cohort of older adults previously diagnosed with mild cognitive impairment.
**FORCHRONIC**

Formulation of food products for the prevention and targeted treatment of chronic diseases related to metabolism (AGL2016-76736-C3-3-R)

Principal investigator: Dr. Ana Ramírez de Molina  
Funded by: Ministerio de Economía y Competitividad  
Duration: 2016 - 2019

The objective of the project FORCHRONIC is to design, develop and validate the effect and safety of new formulas for humans, effective in regulating the molecular mechanisms of cellular cholesterol transport and the activation of fatty acid synthesis, fundamental routes in the development of colorectal cancer, obesity and metabolic syndrome, in order to achieve food products with high added value, highly effective as nutritional supplements aimed at preventing and improving the treatment of these diseases.

The project is based on two hypotheses resulting from the previous project carried out by the research team within the State Program of R+D+I, Challenging the Society; The regulation of ABCA1 metabolism genes and the ACSL / SCD pathway allows the control of cholesterol transport pathways and the activation of fatty acid synthesis, associated with the development of chronic diseases such as colon cancer and the metabolic syndrome; Formulas based on the combination of polar lipids and bioactive principles of natural origin can provide for efficient regulation of metabolism genes due to potentiation of bioavailability and synergistic biological activity.

**Intesti-nAhRuNg**

Therapeutic modulation of non-coding RNAs through bioactive components of the diet: impact on pathophysiological regulation of lipid metabolism (AGL2016-78922-R)

Principal investigator: Dr. Alberto Dávalos Herrera  
Funded by: Ministerio de Economía y Competitividad  
Duration: 2016 - 2019

Despite advances in the prevention and the success of many widely prescribed drugs for the management of dyslipidemia, cardiovascular disease remains a leading cause of mortality. This highlights the need for deeper insight into disease mechanism and innovative therapeutic strategies. A large amount of novel transcripts from our genome are transcribed into different types of noncoding RNAs (ncRNAs) including microRNAs (miRNAs) and long noncoding RNAs (lncRNAs). Several novel ncRNAs are being identified as regulators of different biological processes and associated with different complex human diseases. Moreover, recent evidence suggests that the expression of certain miRNAs and lncRNAs can be modulated by food bioactive components. The emerging function of ncRNAs in cholesterol and lipid metabolism and their possible modulation by diet, open up new therapeutic possibilities. “Intesti-NahRuNg” aims to characterize the role of novel miRNAs and lncRNAs in both the physiological and pathological processes of intestinal lipid metabolism and test their therapeutic modulation through dietary bioactive compounds.
NUPROBED
Formulation of food products for the prevention and targeted treatment of chronic diseases related to metabolism (AGL2016-76736-C3-3-R)

Principal investigator: Dr. Pablo Fernández Marcos
Funded by: Fundación BBVA
Duration: 2016 - 2018

Obesity and the pathologies derived, encompassed under the term Metabolic Syndrome, are considered one of the main health challenges of the 21st century. Many naturally occurring extracts have been used against obesity and diabetes for centuries, in many cases with beneficial effects and few side effects, and almost always without a thorough knowledge of their mechanisms of action. The NUPROBED project, which is being carried out by IMDEA Food in collaboration with the Institute of Food Science Research (CIAL) and the National Cancer Research Center (CNIO), aims to find new bioactive products derived from foods with potential against Obesity, thanks to its effects on the main metabolic signaling pathways involved in this pathology. This project contemplates conducting a bioactive product search through high performance biological research platforms (HTS) testing four crucial metabolic pathways for obesity and diabetes: Insulin pathway, mitochondrial potential, pentoses phosphate pathway and adipogenesis.

GEPS - CM
Population, family and aging in the contemporary world: dimensions of an ongoing process (S2015/HUM-3321)

Principal investigator: Dr. David Sven Reher Sullivan (UCM)
IMDEA Food participant investigator: Dr. Lidia Daimiel Ruiz
Funded by: Consejería de Educación, Juventud y Deporte. Comunidad de Madrid
Duration: 2016 - 2018

The Project GEPS: “Population, family and aging in the contemporary world: different dimensions of an ongoing process” is root in the Social Sciences sphere but with the purpose of gathering professionals from the Health Sciences and the Social Sciences to study different aspects of the aging process. In the frame of this project, different studies will be carried out that focus on:

- Fertility and reproduction
- International migrations and demographic shift
- Family
- Economic challenges associated with the aging society
- Active life in elder people
- Nutrition and quality of live in the aging process

This project offers a multidisciplinary study of aging process from a historical, demographic, sociological, economical and biological point of view. As a result, this project will allow to gain a deeper understanding of the effect of aging on the society that will pave the way to the development of new programs and policies to face the challenge of the aging society.
3.2 International Consortia

**NUTRITECH**
Application of new technologies and methods in nutrition research the example of phenotypic flexibility (GA289511)

Principal investigator: Dr. José María Ordovás Muñoz
Funded by: Comisión Europea. VII programa Marco I+D
Duration: 2012 - 2016

A total of 23 research groups are involved in the Nutritech project. These groups from a variety of European and American leader institutions in the research field of Nutritional Genomics. Using technical and analytical methodologies, Nutritech will evaluate the gen-nutrient relationship. The included technologies are the most novel biological technologies. They refer to omics technologies such as genomic, transcriptomic, proteomic and metabolomics, among others. The application of all these technologies to the nutritional genomics research will allow revealing the dietary modulation of genes from different perspectives to define how the effect of the diet on genes expands to proteins and metabolites.

**COST Action-POSITIVe**
Interindividual variation in response to consumption of plant food bioactives and determinants involved (FA 1403)

Principal investigator: Dr. José María Ordovás Muñoz
Funded by: European Commission
Duration: 2014 - 2018

To combat the burden of cardiometabolic disease, which constitutes a major public health issue in Europe, it is of crucial importance to develop efficient strategies that target the dietary behaviours of European consumers and improve the food supply. Plant foods are rich sources of a large range of bioactive compounds that beneficially affect our health, particularly by decreasing the risk of cardiometabolic diseases.

POSITIVe specifically addresses inter-individual variation in bioavailability and physiological responses to consumption of plant food bioactives in relation to cardiometabolic endpoints.
Inflammarine
Anti-inflammatory and healing activity of sea cucumber (Isostichopus badionotus) in a murine model: characterization of pharmacological activity and cellular mechanisms involved (CB.2013-01 No. 22173)

Principal investigator: Dr. Alberto Dávalos Herrera
Funded by: CONACYT Consejo Nacional de Ciencia y Tecnología (Mexico)
Duration: 2015 - 2018

Uncontrolled inflammatory response is a major driver of many modern human chronic diseases. The natural world has been the source of novel anti-inflammatory and other biologically-active agents. Plants, insects and marine organisms, including algae and invertebrate marine organisms, have been screened for the presence of anti-inflammatory agents. Sea cucumbers are marine invertebrates, considered by the traditional Chinese medicine as tonic foods, attributing them with a wide range of biological effects, including anti-inflammatory. However, their mechanism of action is poorly described. Isostichopus badionotus, is a sea cucumber from the Peninsula of Yucatan (Mexico) whose many biological activities are not well characterized.

“inflammarine” aims to contribute to a better understanding of the anti-inflammatory activity and mechanisms of action of the bioactive components of sea cucumber I. badionotus. Our results will allow the development of possible therapies from this marine invertebrate and support the search for therapeutic alternatives to combat the devastating consequences of the chronic inflammatory processes that today afflict our modern society.
3.3 Research grants

Programme: “Marie Curie” AMAROUT II Europe Programme
(Grant Agreement nº 291803)

- **Dr. Cristina Aguirre Portolés**
  Type: Incoming Fellow
  Category: Experienced researcher
  Duration: 2015 - 2017

- **Dr. Han Joosten**
  Type: Incoming Fellow
  Category: Experienced researcher
  Duration: 2015 - 2016
  Funded by: Comisión Europea. VII Programa Marco I+D

Contract for technical support personnel (PTA2013-8144-I)

- **Mónica Gómez Patiño**
  Principal investigator: Dr. Ana Ramírez de Molina
  Funded by: Ministerio de Economía y Competitividad
  Duration: 2014 - 2017

Contracts Juan de la Cierva - (FJCI-2014-19601)

- **Dr. Clara Ibañez Ruiz**
  Funded by: Ministerio de Economía y Competitividad
  Duration: 2016 - 2018

Contracts Ramón y Cajal (RYC-2015-18083)

- **Dr. Moisés Laparra Llopis**
  Funded by: Ministerio de Economía y Competitividad
  Title: Influence of bioactive components on the enterohepatic axis
  Duration: 2016 - 2021

Contracts for Research Assistants (PEJ15/BIO/Al-0355)

- **Elena García Carrascosa**
  Funded by: Consejería de Educación, Juventud y Deporte. Comunidad de Madrid
  Duration: 2016 - 2017
Program “José Castillejo” Mobility stays abroad for young doctors (CAS15/00081)

- Dr. Lidia Daimiel Ruiz

Funded by: Ministerio de Educación, Cultura y Deporte
Duration: 2016 - 2017

Program “José Castillejo” Mobility stays abroad for young doctors (CAS16/00232)

- Dr. Alberto Dávalos Herrera

Funded by: Ministerio de Educación, Cultura y Deporte
Duration: 2016 - 2017

Laboratory Practice Program

- Daniel de la Nava

Funded by: AECC-Asociación Española contra el Cáncer
Duration: 2016

Grants for training university teachers. (FPU014/06386) (FPU014/06386)

- Silvia Berciano

Principal investigator: Dr. José María Ordovás Muñoz
Funded by: Ministerio de Educación, Cultura y Deporte
Duration: 2015 - 2016

Grant for research in oncology.

- Dr. Pablo José Fernández Marcos

Characterization of sirtuins involvement in the development of hematopoietic neoplasm and other tumor types

Funded by: Asociación Española Contra el Cáncer – AECC. Ayudas para Investigación en Oncología
Duration: 2015 - 2017
3.4 Contracts with companies

**Determination of genetic variants associated with genetic studies**

Principal investigator: Dr. Ana Ramírez de Molina  
Funded by: PEACHES, S.L.  
Duration: 2016 - 2017

**PolyMicroBio**

Ellagitannins as a tool to study the interindividual viability in the polyphenol metabolism: Relationship with the genotype and intestinal microbiota postpartum-lactation, children, adolescents and adults (normal weight, obesity and metabolic syndrome). Collaboration agreement for the project AGL2015-64124-R

Principal investigator: Dr. Ana Ramírez de Molina  
Funded by: Centro de Edafología y Biología Aplicada del segura (CEBAS - CSIC)  
Duration: 2016 – 2019

**Evaluation of p21 induction and associated molecular pathways in response to short-term fasting**

Principal investigator: Dr. Pablo José Fernández Marcos  
Funded by: Centro Nacional de Investigaciones Oncológicas (CNIO)  
Duration: 2016

**Risk&RNAs**

Literature review of baseline information on non-coding RNA (ncRNA) that could support the food/feed risk assessment of ncRNA-based GM plants

Principal investigator: Dr. Alberto Dávalos Herrera  
Funded by: European Food Safety (EFSA)  
Duration: 2016 – 2017
PRIMICIA
Personalized Nutrition to bring to market high efficiency food (Strategic Program National Business Research Consortia - CIEN)

IMDEA Food leads the scientific program of the consortium of food companies that carry out the PRIMICIA project, under which six new scientific studies have been developed for the companies:

**Alvinesa Alcoholera Vinícola S.A.U.**
Principal investigator: Prof. Guillermo Reglero Rada
Duration: 2015 - 2017

**Grupo Natac S.L.**
Principal investigator: Prof. Guillermo Reglero Rada
Duration: 2015 - 2017

**Tutti Pasta S.A.**
Principal investigator: Prof. Guillermo Reglero Rada
Duration: 2015 - 2017

**AMC Innova S.L.**
Principal investigator: Prof. Guillermo Reglero Rada
Duration: 2015 - 2017

**Dulces y Conservas Helios S.A.**
Principal investigator: Prof. Guillermo Reglero Rada
Duration: 2015 - 2017

**Galletas Gullón S.A.**
Principal investigator: Prof. Guillermo Reglero Rada
Duration: 2015 - 2017

Funded by: Centro para el Desarrollo Tecnológico Industrial. Ministerio de Economía y Competitividad

Place: Madrid
Date: December 20, 2016
5.2 Congress, invited conferences and courses

The section includes invited lectures and participation in scientific congress and courses by researchers of the IMDEA Food Institute.

5.2.1 Congress coordination and communications

Author/s: Helena Marcos-Pasero, Isabel Espinosa-Salinas, Elena Aguilar Aguilarr, Rocío de la Iglesia González, Jesús Herranz Valera, Susana Molina Arranz, Guillermo Reglero Rada, Ana Ramírez de Molina, Viviana Loria-Kohen
Title: “Estado nutricional y calidad de vida en pacientes con Síndrome Químico Múltiple”
Communication: Oral communication
Event: V Conference Addinma
Place: Madrid
Date: March 11 - 12, 2016.

Author/s: Cristina Aguirre Portolés
Title: "Obesity and colon cancer: relevance of cholesterol metabolism in tumorigenesis and tumor microenvironment”
Communication: Poster
Event: Tumour Microenvironment and Signalling Symposia (EMBL)
Place: Heidelberg, Germany
Date: April 2 – 4, 2016

Author/s: José María Ordovás Muñoz
Title: “Applying Big Data Approaches to Study Food and Diet Patterns on Health Markers”
Communication: Oral communication
Event: Experimental Biology Congress
Place: San Diego (USA)
Date: April 2, 2016

Author/s: José María Ordovás Muñoz
Title: “Polyphenols, flavonoids & Genomic-based precision Medicine”
Communication: Oral communication
Event: Experimental Biology Congress
Place: San Diego (USA)
Date: April 2, 2016

Author/s: Helena Marcos-Pasero, Isabel Espinosa-Salinas, Elena Aguilar Aguilarr, Rocío de la Iglesia González, Ana Ramírez de Molina, Guillermo Reglero Rada, Viviana Loria-Kohen

5.2.3 Courses

**Title:** Estadística aplicada a la investigación biomédica con R  
**Coordinating researcher:** Jesús Herranz Valera  
**Date:** October 24 – 26, 2016

**Title:** “Técnicas analíticas aplicadas en las ciencias ómicas: técnicas de separación” and “Técnicas analíticas aplicadas en las ciencias ómicas: espectrometría de masas”. Taught within the master “Gestión y Desarrollo de Tecnologías Biomédicas” at Universidad Carlos III  
**Researcher:** Clara Ibáñez Ruiz  
**Date:** November 2016

**Title:** “Nutrigenética del tiempo: alimentando al reloj molecular”. Taught within the degree of Human Nutrition and Dietetics at Universidad Autónoma de Madrid  
**Researcher:** Lidia Daimiel Ruiz  
**Date:** November 14, 2016

**Title:** Técnicas estadísticas de Data Mining con R  
**Coordinating researcher:** Jesús Herranz Valera  
**Date:** December 12 - 15, 2016
6.1 Headquarters [98]

6.2 Scientific infrastructures [100]
6.1 Headquarters

IMDEA Food headquarters are located in the old Main Building of the Cantoblanco Hospital since beginning of 2014. The building, ceded to the Institute by the Consejería de Educación y Empleo de la Comunidad de Madrid (the Education, Youth and Sport Council of the Madrid Region), is an excellent space in which to undertake scientific research.

It is located next to the Cantoblanco Campus of the Universidad Autónoma de Madrid with which the Institute has strong cooperative ties – within the grounds of the Cantoblanco University Hospital.

The building occupies an area of 4,595 m² and is divided into two symmetrical main sections of five stories each that can house up to 100 researchers. It is equipped with laboratories of molecular and cellular biology P2, genomics and instrumental analysis, as well as facilities for clinical trials in humans.

In 2016, has started the project for completing the Institute’s Insfraestructures in the west wing of the building. This project includes the construction of new research areas (including new laboratories and experimental animal facilities) provided with advanced technical and scientific equipment.
6.2. Scientific infrastructures

Currently the building is equipped with research laboratories, all of which are fitted with advanced scientific-technical hardware.

**Laboratory 1. Cell Culture Laboratory (Biosafety Level 2)**

This Biosafety Level 2 laboratory allows research to be undertaken on a wide range of moderate risk agents. It is routinely used in experimentation on, and the maintenance of, cell cultures.

It is equipped with incubators for maintaining cells under optimum growth conditions, laminar flow cabinets for working in sterile conditions, plus all the basic equipment needed for work on cell cultures, such as microscopes, water baths, centrifuges and cell counters. It also has a fluorescence microscope and a nucleofector system, which are required in certain experiments. It has the latest equipment for analysis of metabolic activity (SeaHorse) apparatus, along with a fluorescence microscope and a nucleofector, a pressure reducer, an apparatus with micro-electric biosensors for cellular assays with real-time results and an analyzer with Luminex technology.

**Laboratory 2. Genomics Laboratory**

The Genomics Laboratory contains equipment required for genetic, genomic, transcriptomic and epigenetic analyses, etc. It is fitted with all the basic equipment required, such as thermocyclers for performing conventional PCR work, an ABI PRISM HT 7900 apparatus for real-time PCR, plus equipment for gene expression and high performance genotyping analysis, such as the latest generation QuantStudio™ apparatus. The versatility of these systems allows analyses to be performed in different formats depending on the number of samples to be tested, from the use of 96-well plates through to chips capable of performing 3,072 genotyping reactions. These devices have different applications, such as digital PCR, DNA fragment analysis, expression/gene quantification analysis, allele discrimination using TaqMan probes, and the detection of SNPs and mutations, etc.

The laboratory has a designated clean area for processing and extracting nucleic acids from samples originating from clinical trials.
Laboratory 3. Biochemical Instrumental Techniques Laboratory

This multifunctional laboratory is fitted with a range of small apparatuses for the preparation of reagents and solutions, plus more specific equipment for use in biochemical and molecular biological investigations, such as plate readers, a luminometer, a NanoDrop 2000 spectrophotometer, a SpeedVac sample concentrator, and an HPLC apparatus.

It is divided into different areas where different techniques, such as Western blotting and agarose gel separations, and microbiological techniques for the cultivation and handling of bacteria, can be followed.

Laboratory 4. General Biochemistry and Molecular Biology Laboratory

This is where the different research Groups undertake their normal laboratory work. Each Group has its own space equipped with benches and all the reagents and materials required for its research line. Predoctoral students and those undertaking laboratory experience also work in these areas. Fume cupboards are available for handling volatile compounds, there are cupboards for the storage of flammable products and acids etc., and freezers for preserving samples and reagents.

The IMDEA Food installations also have a cold room, a freezing room, a dark room, a cooling and ultrafreezing room, and a cryopreservation tank.
organization

7.1 Organizational structure [103]
7.2 Board of Trustees [103]
7.3 Scientific Council [105]
7.4 Ethics Committee [106]
7.5 Delegate Commission [107]
7.6 Executive Board [107]
7.7 Management Unit [109]
7.1 Organizational structure

The organizational and functional structure of the IMDEA Food Institute is summarized in the diagram below with indication of its main bodies and Groups.

The main governing body of the Institute is its Board of Trustees constituted by representatives of the Madrid Regional Government, 3 Madrid public universities, the Spanish National Research Council (CSIC), internationally renowned food and nutrition scientists, industrial partners and independent experts.

The Institute carries out its scientific research activity directed by its own management team and advised by a Scientific Committee composed of members of recognized international prestige, the Scientific Council and a Research Ethics Committee.

7.2 Board of Trustees

The Board is the highest body of government, representation and administration of the Foundation. The authority of the Board encompasses all matters concerning the government and administration of the Foundation, without exception, and the resolution of all legal and circumstantial incidents that occur. The Board is responsible for complying with the foundational purposes and for administering the assets and rights that constitute the patrimony of the Foundation, assuring their correct performance and effectiveness.
PRESIDENT OF THE FOUNDATION
Manuela Juárez Iglesias
Professor “Ad Honorem”
Spanish National Research Council.
Madrid. Spain

VICE-CHAIRMAN OF THE FOUNDATION
Rafael van Grieken Salvador
Chairman of Board of Education, Youth and Sport

Murcia, Spain
### 7.4 Ethics Committee

The IMDEA Food Foundation, is a public institution of the Madrid Regional Government, aware of its duty and responsibility to society in terms of monitoring and control of the research and its ethical aspects.

In order to do it in an effective manner has established a Research Ethics Committee (according to the Article 12 of Law 14/2007, July 3, of biomedical research, and Article 22 of Royal Decree 1201/2005) to provide a quick and effective response to the needs of scientific research carried out in the field, in order to protect fundamental rights of people, animal welfare and the environment, and to respect bioethical principles and commitments made by the scientific community and by the Statutes of the Foundation.

7.5 Delegate Commission

All the powers of the Board of Trustees are delegated to the Foundation’s Delegate Commission, with the exception of approval of the action plan, budgets, annual accounts amendment of statutes, mergers, liquidation, extinction and any acts requiring the authorization of the Protectorate. Also, they may not elect or dismiss any trustee or appoint officers of the Board, elect or dismiss the Director, or take any decision having to do with the Scientific Council, or grant powers of attorney or general delegations.

President
José Manuel Torralba Castelló

Members
Rafael A. García Muñoz
Daniel de la Sota Rius
José de la Sota Rius

Secretary
Julián García Pareja

7.6 Executive Board

The Executive Board is composed of the Director, the Deputy Director and the General Manager. The Executive Board is responsible for managing and dealing with the main business administration and scientific activities of the whole Institute, except those decisions taken by or shared with the Board of Trustees.

Director
Prof. Guillermo Reglero Rada

It is the Director’s responsibility, pursuant to the powers and guidelines granted by the Board, to represent the Foundation and sign on its behalf; to direct, promote and oversee all the activities of the Foundation.

The Director of the Foundation to draw up the annual performance plan and the four-year target plan, as well as the general plan of activity of the Foundation, determining its needs and resources, as well as the necessary means to achieve the Foundation’s objectives; to formulate budgets and annual accounts; to establish the distribution and application of the funds available to meet the purposes of the Foundation.
Deputy Director
Dr. Ana Ramírez de Molina

The Deputy Director is appointed by the Board or by the Executive Committee at the proposal of the Director. She reports directly to the latter and assists him in his tasks, representing him in case of his absence or inability to act.

General Manager
Inmaculada Galindo Fernández

The General Manager is appointed by the Board or by the Executive Committee at the proposal of the Director, to whom he reports. Her functions are to manage and coordinate the general services of the Foundation, in particular, the administrative, financial, economic and legal aspects. She is responsible for the financial and economic control of the Foundation. She draws up the draft budgets and annual accounts. She is responsible for the management of human resources and the implementation and management of policies of social responsibility, health and safety and hygiene at work, gender equality and work-life balance.
7.7 Management Unit

The Unit of Management, Administration and Technical Support is composed of technicians and administrative staff. It performs the technical, administrative and economic management of the research projects and the activities of the Institute, all the infrastructure of the centre and provides technical support to the Research Groups and the Platforms.

strategics

alliances

report 2016
IMDEA Food Institute has reinforced its strategic alliances with public and private entities and has come to new agreements with relevant research institutions.

Cooperation Agreement with the “Centro Nacional de Investigaciones Oncológicas”

In 2015 a framework cooperation agreement between the IMDEA Food Foundation and the “Centro Nacional de Investigaciones Oncológicas” was signed to carry out activities related to scientific research and technological development in the field of life sciences.

Cooperation Agreement with the “Consejo Superior de Investigaciones Científicas”

In August 2015, a Framework Cooperation Agreement was signed between IMDEA Food Foundation and “el Consejo Superior de Investigaciones Científicas” to facilitate cooperation in scientific and technological activities, exchange of staff that will promote scientific progress of both institutions and the implementation of programs and research projects.

Cooperation Agreement with the “Universidad Autónoma de Madrid”

In 2014 a framework cooperation agreement between the IMDEA Food Foundation and the Universidad Autónoma de Madrid was signed to carry out activities related to scientific research and technological development and university undergraduate and graduate students, in the field of nutrition, food and health.

Cooperation Agreement with the “Hospital Universitario Infanta Sofía”

In December 2013, a Framework Cooperation Agreement was signed between IMDEA Food Foundation and the “Hospital Universitario Infanta Sofía”. This agreement tries to encourage the development of the scientific and technological activities in the areas of health, nutrition and biomedicine.

Cooperation Agreement with Metabolon Inc.

In April 2013, a Framework Cooperation Agreement was signed between IMDEA Food Foundation and Metabolon Inc. for which facilitates and encourages the development of research and technological activities.
Cooperation Agreement with the “Fundación Española de la Nutrición”

In April 2013, a Framework Cooperation Agreement was signed between IMDEA Food Foundation and the “Fundación Española de la Nutrición”, for which facilitates and encourages the development of research and technological activities to contribute to the advancement of Nutrition Science and the improvement of the population health through correct nutrition.

Cooperation Agreement with the “Universidad de la Concepción de Chile”

In July 2013 a Framework Cooperation Agreement was signed between IMDEA Food Foundation and the Pharmacology Faculty of the “Universidad de la Concepción de Chile”. This agreement tries to encourage the development of research activities and cooperation between the research staff of both institutions in order to prevent the high rate of obesity in Chile.

Cooperation Agreement with the “Universidad de Murcia”

In May 2012, a Framework Cooperation Agreement was signed between the IMDEA Food Foundation and the University of Murcia for which facilitates and encourages the development of research activities through participation in consortia or networks, participation at calls, research training and exchange of staff between the two institutions.

Cooperation Agreement with the “Centro Regional de Estudios en Alimentos Saludables”

In October 2011 a Framework Cooperation Agreement was concluded between “Centro Regional de Estudios en Alimentos Saludables” and IMDEA Food Institute to facilitate cooperation in scientific and technological activities, exchange of staff that will promote scientific progress of both institutions and the implementation of programs and research projects.

Cooperation Agreement with the “Instituto Maimónides de investigación Biomédica de Córdoba”

In October 2011 a Bilateral Agreement was signed between the “Instituto Maimónides de investigación Biomédica de Córdoba” and IMDEA Food to establish cooperation for its commitment of genuinely fostering sustainable development in the scientific activities and projects.
Cooperation Agreement between the “Universidad Autónoma de Madrid” and the Platform for Clinical Trials for Nutrition and Health “GENYAL”

The cooperation between the “Universidad Autónoma de Madrid” and the platform is reflected at the Cantoblanco University Campus from where most of the volunteers of the studies are selected. Moreover, the “Universidad Autónoma de Madrid” provides facilities to IMDEA Food Institute and support to medical staff.

Collaboration with the “Hospital Universitario La Paz”

IMDEA Food collaborates with the Department of Nutrition and Dietetics and the Department of Clinical Oncology and Research Group of IdiPaz Institute at La Paz University Hospital (Madrid), in the field nutritional genomics.

Collaboration with the “Hospital Universitario Ramón y Cajal”

IMDEA Food collaborates with the Department of Biochemistry and Research of the Hospital “Ramón y Cajal” (Madrid), in the field of lipid metabolism.

International Campus of Excellence UAM+CSIC

IMDEA Food Institute has joined the International Campus of Excellence UAM+CSIC, which was awarded International Campus of Excellence status by the Spanish Ministries of Education and Science and Innovation on the 26th of November 2009.

Association Agreement with Madrid Science Park

In June 2008 a General Association Agreement was concluded with Madrid Science Park for cooperation between the Park and IMDEA Food Institute, with the aim of making the most of the advantages that such an association offers in terms of R+D+I activities, and more specifically in the activities and services that characterize it as a site and agent of innovation, in addition to providing cooperative access to the network of parks in Madrid and Spain and allied agents.

report
2016
In The Spotlight…
Nutritional Genomics and Epigenomics Group

Nutritional Genomics and Epigenomics Group is currently carrying out the PREDIMED-PLUS project. PREDIMED-PLUS is a multidisciplinary multicenter study involving 23 research groups from Spain. The PREDIMED-PLUS consortium has recruited more than 6,800 participants with obesity and metabolic syndrome between 55 and 65 years without previous Cardiovascular Disease (CVD). Participants have been randomly distributed in one of two groups: control and intervention group. Participants in the control group receive educational individual and group sessions twice a year to encourage them to adhere to a Mediterranean Diet. Participants in the intervention group are visited every month by a team of nutritionists and specialists in physical activity and follow a hypocaloric Mediterranean Diet and a physical exercise program. Along the 6 years of follow-up we will record the incidence of CVD and other co-morbidities in the 2 groups.

Our group has recruited 170 participants in 6 different primary care centers of Madrid and one hospital:

- C.S. Aquitania
- C.S. Buenos Aires
- C.S. Bustarviejo
- C.S. Colmenar Viejo
- C.S Fuencarral
- C.S. Ibiza
- Hospital La Paz

For this purpose, the Nutritional Genomics and Epigenomics Group has created a network of more than 40 physicians and nurses that have collaborated in the participant’s recruitment and are currently involved in the clinical management of the participants.

At present, this project is in the early intervention phase. Results are coming soon.

Nutrients, 2016. 8(12)

Highlighted Projects

Obesity and cancer: from molecular mechanisms to disease prevention

Molecular Oncology Group

One of our main lines of investigation is the association between obesity and cancer prognosis with special focus in the direct implication of excessive adipose tissue in tumor microenvironment.

The dietary patterns have changed during the last decades: the physical activity has decreased in parallel with a significant increase in caloric intake. This energetic imbalance gives rise to a metabolic shift that generates hypertrophy and hyperplasia of adipose tissue leading to overweight and eventually to obesity. According to The World Health Organization (WHO), nowadays 13% of the overall adult population worldwide are obese. An unquestionable cause of concern is that in 2014, 41 million children under the age of 5 years were overweight or obese (WHO). Obesity has been implicated in the development of cardiovascular diseases and type-2 diabetes\(^1\) as well as in the initiation and dissemination of several types of cancer\(^2\).

In fact, overall risk of death from cancer is 1.5-1.6-fold higher in men and women with a BMI>40Kg/m\(^2\). There are not enough data supporting the reversibility of obesity effects when the patients are already diagnosed for cancer. Thus, we should fight against obesity earlier in age and raise awareness about the importance of keeping healthy habits in the youngest population. Social education for health promotion, the individual responsibility as well as the food industry together with basic and translational research need to team up to face this urgent global health challenge.

The main types of cancer whose increased risk has been associated with obesity are: prostate cancer\(^4\), postmenstrual endometrial\(^5\) and breast cancer\(^2\), ovary\(^6\), bladder\(^7\), liver\(^8\), colon\(^9\), pancreas\(^2\), esophageal\(^10\), gallbladder\(^11\), kidney\(^12\) and thyroid cancer\(^13\) (Table 1). The excess of visceral adiposity provokes alterations in cellular composition of adipose tissue which is crucial for growth and dissemination of tumors that grow in a microenvironment rich in adipocytes like breast, ovary or colon tumors\(^14\). Although the epidemiological data are strong, the molecular mechanisms associating obesity and cancer are still poorly understood.

So far, three hypotheses have been defined to link obesity and tumor progression: alteration in the rates of androgenic precursors to oestradiol conversion leading to a hormonal imbalance; insulin resistance and the excess of bioactive IGF1 and systemic inflammation due to and excessive adipokine signaling activation\(^15,16\) (Figure 1). Our main goal is to shed light in new mechanisms linking both pathologies. We focus our research in understanding how lipid metabolism and specially cholesterol imbalance due to excessive adipose tissue in the tumour vicinity could influence cancer progression and dissemination.

Immunonutrition: novel modulators of effectiveness and quality of anti-tumoral responses

Molecular Immunonutrition

The unprecedented non-alcoholic fatty liver disease (NAFLD) pandemic is going to have a strong impact on future morbidity rates and a reduction in life expectancy by 5-20 years. NAFLD has become the most common liver pathology worldwide affecting an estimated 15-30% of most populations due to a dramatic increase of risk factors such as obesity, sedentary life style and altered food supply and preferences. Thus, 10-20% of subjects with NAFLD will have the severe variant of non-alcoholic steatohepatitis (NASH), hepatic inflammation and the development of liver fibrosis with high liver related morbidity and mortality, part of which is due to the development of hepatocellular carcinoma. Innate immune Toll-like receptor (TLR)-4 and gut microbiota has been identified as determinants for hepatocellular carcinoma promotion.

While the host's endogenous factors are difficult to influence, the environmental factors are predominant and addressable in a preventive or therapeutic intention. A clear example is the activation of intestinal innate immune responses via toll-like receptor (TLR)-4 by defined protease inhibitors present in cereals. TLR4 activation in macrophages, central in coordinating innate immune responses, is associated to metabolic changes influencing functional differentiation and antigen presentation and, thereby, effector T cells function and activity. In this context, lipid mediator profiles change with macrophages phenotype.

In the group of Molecular Immunonutrition in the Metabolic Dysfunction and anti-Tumoral Response, we have recently defined significant a different cytotoxic and immunogenic potential of protease inhibitors from wheat and ancient-Latin American grains. This contribution helps to understand the role of immunonutritional food components to enforce the development of immune-based precision intervention tools and strategies as well as innovative scientific, translational and transferable, relevant aspects to improve the production of innovative healthier products.

Therefore, this immunonutritional-based precision imprinting is an example of how to overcome the usually fragmented and compartmentalized approach to address the impact of innate immune responses in NAFLD. Here, a better understanding and the use of immunonutritional compounds will help to reduce the socioeconomic burden and risk factors for NAFLD i.e., diabetes, obesity, and hyperlipidemia as well as the metabolic syndrome. Effective immunonutritional-based precision prevention/therapeutic strategies could also help to promote a healthier intrauterine immunity. Thus, the use of immunonutritional-based precision tools that ameliorate/prevent NAFLD represents a new hope to help arming the clinical/scientific community with effective translational and transferable strategies targeting not only liver-related diseases, but also progress to fibrosis and hepatocellular carcinoma.
Figure 1. The influence of innate immune signaling promotes a metabolic switch in macrophages and tumoral cells that affects antigen processing and priming of adaptive T cell responses. These processes can be modulated by immunonutritional factors to selectively define the quality and quantity of T cell response(s).

Hydroxytyrosol fights cognitive declines
Bioactive Ingredients Food Group

The Bioactive Ingredients Food Group published the first evidence that hydroxytyrosol and – therefore – consumption of high-quality olive oil might prevent cognitive decline and Alzheimer’s disease via restoration of proper cerebral insulin signaling. Alzheimer’s disease (AD) is an irreversible neurodegenerative disorder, characterized by progressive memory deficit and neuronal loss, whose prevalence is increasing due to population aging. Recent prospective studies showed that the Mediterranean diet is associated with lower incidence of AD and can improve cognition. In this study, we demonstrate that HT protects Aβ(25-35)-treated astrocytes by improving insulin sensitivity. These data provide some mechanistic insight on the observed inverse association between Mediterranean diet score (and olive oil consumption) and prevalence of cognitive impairment. Future, ad-hoc human studies will eventually verify whether the use of HT as nutritional supplement could reduce IR associated with AD and, in turn, improve AD symptoms and clinical manifestations.

Targeting cardiometabolic disorders by sea-derived organisms and metabolites

Epigenetics of Lipid Metabolism Group

The increasing interest in natural sources of bioactive substances, with not only essential compounds for nutrition, but also with pharmaceuticals potentials has lead researchers to study different marine organisms. Sea cucumbers are marine invertebrates, belonging to the class Holothuroidea, habitually found in the benthic areas and deep seas across the world. They have been considered by the traditional medicine as tonic foods in Asia and Middle East. Moreover, they have been attributed with a wide range of biological effects, including antioxidant, antimicrobial, antithrombotic, anticoagulant, healing, antioxidant, anti-hypertension, cytostatic and anti-inflammatory.

The therapeutic properties have been attributed to chemical compounds extracted from the sea cucumber’s body wall. Among molecules described in different sea cucumber species include: triterpene glycosides (saponins), chondroitin sulfates, glycosaminoglycan (GAGs), sulfated polysaccharides, sterols (glycosides and sulfates), phenolics, cerebrosides, lectins, peptides, glycoproteins, glycosphingolipids and essential fatty acids.

There are several species from the genera Apostichopus, Holothuria, and Cucumaria that have been widely studied for their components and biological action. However, others species from the genera Actinopyga, Bohadschia, Parastichopus and Isostichopus remain poorly characterized, despite their high commercial value and potential in production systems.

In this context, IMDEA Food Institute researchers in collaboration with researchers from the Department of Recursos del Mar from the “Centro de Investigación y Estudios Avanzado” (Cinvestav) “Unidad de Mérida” (Mérida, Yucatán, Mexico) have studied the beneficial effects –on growth and body lipid profile in young rats– of different meals containing Isostichopus badionotus from Yucatan Peninsula. Their results reported that sea cucumber consumption modulate gene expression of key genes involved in cholesterol and lipid metabolism in the liver. Indeed, diets containing I. badionotus repressed the induction of key genes associated with dyslipidemia exerted by cholesterol supplementation. Their findings suggested that consumption of I. badionotus from the Yucatán Peninsula is beneficial for dyslipidemia, and showed that the biological effect is clearly dependent on the preparation method.

Dyslipidemia is only part of the story, as other biological functions are currently being evaluated by the researchers. As uncontrolled inflammatory response is a major driver of many modern human chronic diseases, the research team is now focusing on possible anti-inflammatory effects of molecules found in this type of marine organism. Some previous studies have reported the anti-inflammatory effects of other species of this genera including Apostichopus, Stichopus, Holothuria, Cucumaria, or Parastichopus. However, there is scarce information for Isostichopus badionotus. Their preliminary results testing different components from body wall extracts suggest that fucosylated chondroitin sulphates from Isostichopues badionotus of Yucatan peninsula (unpublished data) exert strong in vivo anti-inflammatory properties by modulating key pathways related to inflammation. Understanding the molecular mechanisms exerted by fucosylated chondroitin sulphates isolated from sea cucumber from the Yucatan Peninsula will open up novel opportunities to combat our modern human disease related to inflammation.

p21 as a molecular driver of fasting

Metabolic Syndrome Group

The exact molecular mechanisms driving the fasting-mediated protection from chemotherapy toxicity and fasting-mediated enhanced and anti-tumor immune response have not yet been described. Recently, our laboratory has participated in a project uncovering a possible mechanism for this protection: we described a strongly increased transcription of the cell cycle inhibitor p21 (also known as Cip1 or CDKN1a) upon short-term fasting in different mouse tissues\(^1\). Importantly, we have later verified that this mechanism is conserved in humans: our laboratory has carried out a clinical trial at IMDEA Food subjecting 20 healthy human volunteers to 36 hours of fasting, and obtaining blood samples to measure p21 mRNA levels in peripheral blood mononuclear cells (PBMCs) before and after fasting, and 24 hours after refeeding. As shown, we could observe a significant increase in p21 mRNA levels after the fasting period, that were recovered back to normal after 24 hours of refeeding. Importantly, this behavior was parallel to several target genes of the fasting-responsive nuclear receptor PPAR\(\alpha\) (PDK4 and CPT1a)\(^2\), indicating that p21 is also a fasting-regulated gene in humans.

The Products Program highlight
Food Products for Precision Nutrition Program

The last 10 years have seen public and private resources pumped into the development of functional foods in Spain and Europe. Functional foods with anticarcinogenic properties have been of particular interest. In most cases, however, the expected effectiveness was never obtained, and these products have been of limited clinical use. After their incorporation into functional foods, bioactive ingredients that seemed promising in vitro commonly failed to return the hoped-for results in clinical studies. The problem often lay in the low solubility of these ingredients in water, which limits their solution in the intestinal lumen. This in turn leads to their poor stability during digestion and the promotion of their precipitation and degradation. They thus suffer from poor bioaccessibility (the quantity soluble in, and therefore absorbable from, the intestinal lumen) in the gastrointestinal tract, and low bioavailability (the capacity to be absorbed by the intestinal cells and eventually passed into the bloodstream). New formulations are therefore needed that can overcome these problems and help these bioactive compounds become more active in vivo.

In 2016, in collaboration with the Universidad Autónoma de Madrid, IMDEA Food patented a lipid-based system that not only stabilises many such bioactive compounds during digestion as well as improve their oral bioavailability, but in many cases potentiates their effects. Along with natural bile salts and phospholipids, this ‘self-emulsion-forming’ system produces microemulsions during digestion that stabilise bioactive components, preventing their precipitation or interaction with inhibitors of their absorption. Their bioaccessibility and bioavailability - and in turn their bioactivity - is therefore much improved. The system also allows the lipophilization of molecules that are little soluble in water, facilitating their incorporation into foods. Our researchers have reported a formulation developed by them to have an antiproliferative effect on human colon cancer cells; indeed, a synergistic effect was seen between the vehicle and carried compound was observed.
